Nothing gets the jobs done

Some people never know where their next job's coming from. That's why there's Microsoft® Works, the winner of five major awards—including Macworld's 1987 and MacUser's 1986 *Integrated Product of the Year* awards.

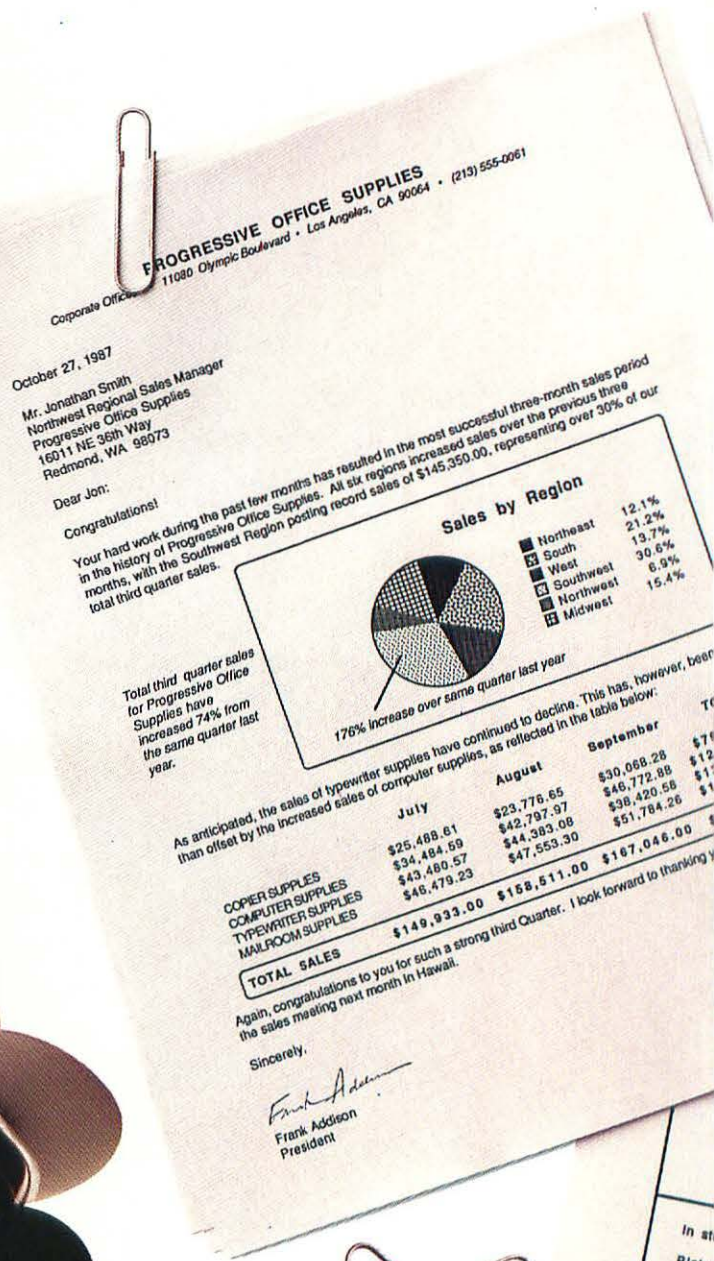

Microsoft Works is a one-disk software program that gracefully integrates:

Word processing, for writing memos, reports, presentations.

A database tool with reporting, to keep track of clients, jobs, vendors.

A spreadsheet with charting, to compute, analyze, interpret, and then graph anything to do with finance or numbers.

Finally, a communications tool which lets you get stock quotes, make travel reservations, do research, and send

October 27, 1987

Mr. Jonathan Smith
Northwest Regional Sales Manager
Progressive Office Supplies
16011 NE 36th Way
Redmond, WA 98073

Dear Jon:

Congratulations!

Your hard work during the past few months has resulted in the most successful three-month sales period in the history of Progressive Office Supplies. All six regions increased sales over the previous three months, with the Southwest Region posting record sales of \$149,933.00, representing over 30% of our total third quarter sales.

Total third quarter sales for Progressive Office Supplies have increased 74% from the same quarter last year.

Sales by Region

176% increase over same quarter last year

As anticipated, the sales of typewriter supplies have continued to decline. This has, however, been than offset by the increased sales of computer supplies, as reflected in the table below:

	July	August	September
COPIER SUPPLIES	\$25,488.61	\$23,776.65	\$30,068.28
COMPUTER SUPPLIES	\$34,484.59	\$42,797.97	\$46,772.88
TYPEWRITER SUPPLIES	\$43,480.57	\$44,383.08	\$36,420.56
MAILROOM SUPPLIES	\$48,479.23	\$47,653.30	\$51,784.26
TOTAL SALES	\$149,933.00	\$158,611.00	\$167,046.00

Again, congratulations to you for such a strong third Quarter. I look forward to thanking you the sales meeting next month in Hawaii.

Sincerely,

Frank Addison
President

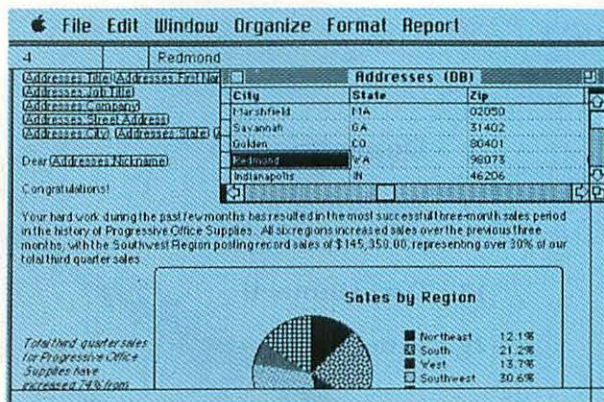

reports across the country, right over the phone lines.

Microsoft Works is seamlessly melded together. You can have all four tools on screen at once. Jump instantly

like Microsoft Works.

from one to another. And later combine work done in each part of the program on a single printed page.

This easy exchange of data makes jobs go faster and much, much easier. (Like form letters where you need to combine names from the database with a memo

written in the word processor.)

Learning Microsoft Works is a snap. It starts with a painless, step-by-step, computer-based training program. Before you know it, you know it.

All in all, Microsoft Works is a superb solution for day to day, get-it-done problems—an inspiring display of convenience, efficiency, and utility.

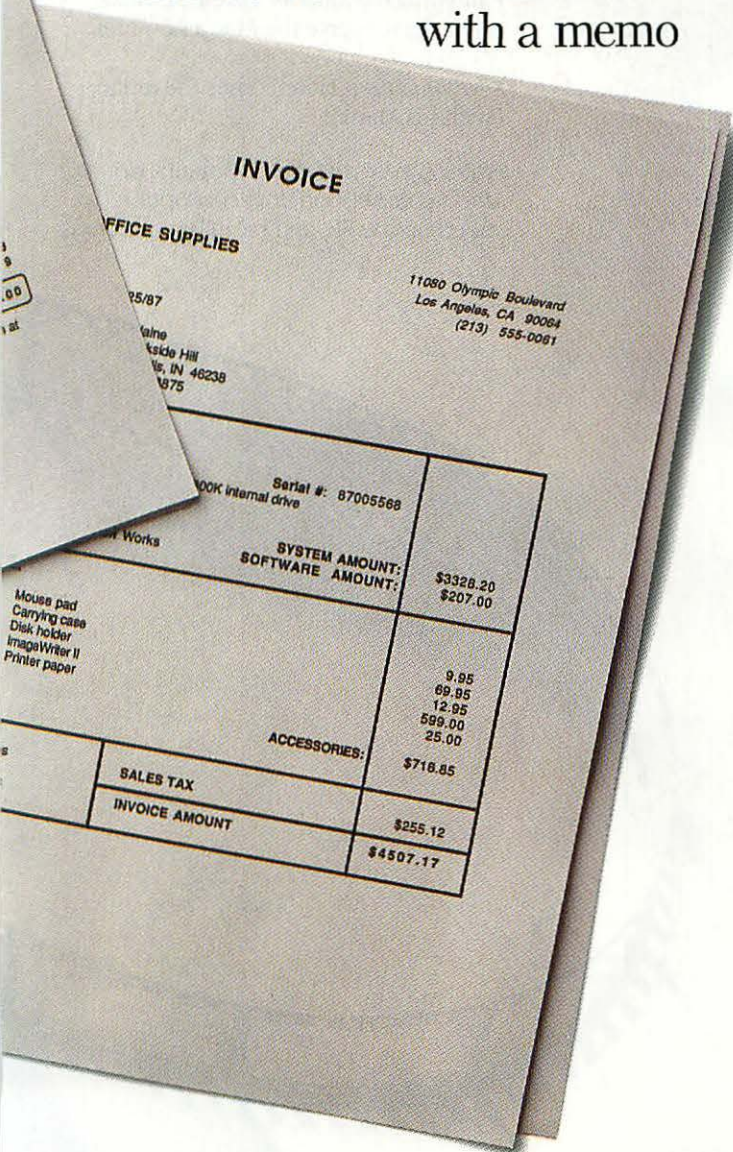

And of course, it's a product of Microsoft, the preeminent developer of programs for the Macintosh.™

If you're in a business that won't let you stick to one thing, check out Microsoft Works—the program that can change jobs as fast as you do.

Microsoft® Works. For everyone.

More than two years after its initial release, Cricket Graph still receives rave reviews. Why? Because Cricket Graph is THE Macintosh standard in business/science graphing.

Elegance Defined

Powerful, yet easy-to-use — it's the measure of "elegance" in any software. Cricket Graph is elegance defined.

Data is entered in a simple, spreadsheet-like format, or it can be imported from many popular formats. Once the data is entered, you select from 12 different graphs and charts — Cricket Graph does the rest!

Full-Color Presentations

Cricket Graph gives you the ability to turn your graphs into dynamic, full-color presentations. You can place several graphs on a single page, add text and symbols, add color — even add three dimensional effects! When completed, you can print your results on a wide variety of devices with Cricket Device Drivers.

THE FIRST FAMILY OF GRAPHICS

When it comes to Macintosh graphics software, there's just one name to remember — Cricket Software. Your local dealer will be happy to introduce you to the entire family: Cricket Graph, Cricket Draw, Cricket Presents... and Cricket Device Drivers.

MAC TO PC ELECTRONIC MAIL THEIR WAY.

MAC TO PC ELECTRONIC MAIL OUR WAY.

Next to InBox,TM the best way to send messages and files between MACs and IBM PCs is to walk. Or run. Or even fly. Because other electronic mail software is complicated, confusing, and in some cases, too stupid to tell the difference between a PC and a carrier pigeon.

InBox is different. In just minutes you'll be composing, sending, and routing messages and files to everyone in your group and other groups. Over an inexpensive AppleTalk network which can include MACs, PCs, and compatibles. From a simple phone message to detailed memos with attached files (like spreadsheets, MORETM documents, letters, graphics, etc.), InBox lets groups or an entire company share information fast. So communication time goes down. And office productivity goes up.

THE CRITICS CHOICE

"As an actual user of the product, I am particularly excited about InBox."

John Sculley, Chairman and CEO, Apple Computer

"The world's best electronic mail system."

Andrew Seybold, President, Infonetics (industry analysts)

"Once you have InBox, you can't live without it."

Joseph Garabpolo, Sr. Manager, Peat, Marwick, Main & Co.

Even if you're not at your desk or if your computer's off, messages, mail, and transferred files are waiting for you... delivery is virtually guaranteed. InBox can be the beginning of hyper-effective communications. And the end of paper mes-

sages and memos. Perhaps that's why InBox is the best seller and *MacUser*

Magazine's "Editor's Choice." If you want instant communication between MACs and PCs, forget pigeons. Get InBox. It's the first

electronic mail software that really flies.

Call 800-64-THINK today for more information.

Power to See your Best

THEIR INSTANT PRESENTATION.

OUR INSTANT PRESENTATION.

If you're a busy manager who wants to look your best at a moment's notice, but don't have time to be an artist, there's only one choice. MORE. Because MORE is the only presentation software that turns ideas into presentations instantly. By doing all the art work for you using its built-in "graphic artist."

MORE is both an award winning outline processor *and* an instant presentation maker. So, for example, you can outline a new product sales plan right now. Then, when you need to present your time table, just click the mouse and that part of your outline becomes a perfectly spaced bullet chart. Want to add impact with shadowing and double lines or different type sizes and fonts? Click again. Or pick another part of the outline, click, and there's your organization chart. You can even print the entire outline

and it's your sales meeting agenda. MORE is easy. Effective. And instant.

MORE outlining helps you get results fast. MORE presentations show off those results even faster. Maybe that's why MORE was named *MAC User's* product of the year. And why it's the best seller. Get more time to map out strategy and prepare for meetings. Get MORE. It's the fastest way to organize and build presentations. Beyond a shadow of a doubt.

For MORE information call 800-441-7234, in California 800-626-8847.

Laser Envelopes

► If you've ever tried to print envelopes on a laser printer, you know how their uneven surfaces and small size can cause spotty printing and misfeeds.

That's why James River Corporation is offering Laser Envelopes (distributed by Pro-Tech of Ludlow, Massachusetts). Each Laser Envelope, which holds a standard business letter, is folded so that the 11-inch preglued pocket and the open flap is 8½ by 11 inches in size, just like an ordinary sheet of paper. The flap is coated with glue that won't melt when it passes by the printer's heating element.

Since the flap of this envelope is not folded under the pocket during printing, you can print a message on the flap simultaneously with the front address.

Taking Off the Limits

► A nationwide bulletin board system called Portal Communications, based in Cupertino, California, is offering unlimited access to Macintosh shareware, electronic mail, and private conferences for only \$10 per month plus Telenet communication charges.

Portal also provides two-way access to Usenet, a distributed conference system spanning four continents and 30 countries, to tens of thousands of users. In addition,

Portal connects to the UUCP, ARPANet, Bitnet, and CSNet networks, many of which are based at major universities where participants know a great deal about the Macintosh.

The community of Macintosh users is growing rapidly, as is the Macintosh BBS system, offering many downloadable files and message sections. Messages are organized much like the Macintosh Hierarchical File System, making it easy to find a specific topic. Portal also hosts nightly real-time conferences like the CB mode used in other services.

MS Write's like Word

► *Microsoft Write* is a low-cost version of the Mac's most popular word processor—*Microsoft Word*. Listing at \$175, it appeals to the more cost-conscious user or one who doesn't want to become involved in the complexity of a full-fledged word processor.

Actually, *MS Write*'s simplicity was relatively easy to come by—Microsoft just eliminated some of *Word*'s features until the program went down in size from 357,274 bytes to 292,657 bytes in the beta version. *MS Write* offers full compatibility with *Word*'s file format, in case users decide to opt for a \$220 upgrade.

But *MS Write* is much more than a stripped-down version of *Word*; according to Microsoft, *MS Write* runs faster and

provides more features than any other Macintosh word processing program in its price range. The program is also relatively easy to use, since it includes a context-sensitive help menu. *MS Write* comes with an integrated spelling checker, a page-preview function, and the ability to convert files to *Word*, *MacWrite*, *Microsoft Works*, and ASCII text.

A Mac II Mainframe Connection

► Novell, the leading local area network (LAN) manufacturer—over 145,000 systems worldwide—now has a LAN that allows the Mac II to emulate popular IBM terminals while accessing a compatible mainframe. To link up to Novell's high-speed LAN, which runs on telephone cabling, you need only an interface board that plugs into a Mac II. The board contains a 10-MHz 80186 processor and 512K of zero-wait-state memory.

Requisite software includes an emulation program that allows you to maintain five concurrent host sessions and use a subset of MS-DOS functions, and a program that provides high-speed transfers of both binary and text files. Each of these products can be purchased separately, or the complete hardware and software package is available for \$1315 from Novell's Communications Products Division, 1157 San Antonio Rd., Mountain View, CA 94043.

ScreenWars

► Apple reportedly intends to challenge Adobe's Display PostScript with an upgraded version of QuickDraw, called NuGraph. NuGraph will send sophisticated screen-description commands to the Mac's video circuitry. Both screen-description languages should pave the way for a new generation of advanced graphics programs.

As of this writing, Adobe seems to be out in front as it writes code to use Display PostScript on the Macintosh, Sun, IBM Series 60, and NeXT computers. Apple is still defining NuGraph's capabilities. But the real battle will be fought behind closed corporate doors as Apple and Adobe woo software and hardware developers with their offerings.

Adobe is sure to herald the use of PostScript in many laser printers and the potential for using the same popular language for both screen and printer. Also, Adobe will offer one screen-description language for all major computers, eliminating the need to rewrite a major portion of a program for each piece of hardware.

Apple is expected to counter with NuGraph's reported ability to write to both screen and printer—so that (like Display PostScript) no translation will be necessary. But it could mean Apple's future printers

(continues)

will be incompatible with most current laser printers.

If enough developers sign up with both Adobe and Apple, then both products will enter the marketplace, where customers will make the ultimate decision about which screen-description language best meets their needs.

Wait for January

► An animated advertisement on disk from General Motors' Buick Division, called *Buick Dimension* and mentioned in November's *Mac Bulletin*, won't be available until late January. Many readers called the toll-free number we listed, only to find it disconnected. Everyone who left a name and address with Buick's corporate headquarters on instructions from local dealers will receive the first available disks for the 1988-model year. Otherwise, to get on the distribution list, send your name and address to: Buick Distribution Center, c/o Adcom Inc., 6845 Dix St., Detroit, MI 48209.

115 Pages of Programs

► Educomp's latest catalog of shareware, public domain, and demonstration software is a veritable encyclopedia of low-cost software, listing the contents of 361 disks in 115 pages. Besides ordering listed software, you can look up the function of programs seen on local bulletin boards.

For example, business offerings include stock market analysis, office management, and *Multiplan* and *Excel* templates. One educational program teaches that Halloween

needn't be scary; another shows the placement of continents on a globe.

Other software available includes graphics, animation, sound and music, start-up sounds, productivity, clip art, *MacDraw* pictures, fonts, PostScript for the LaserWriter, word processing, desk accessories, function keys, communications, utilities, games, and programming.

Disk prices range from \$3.00 to \$8.50 per disk depending on the quantity ordered. To obtain a catalog, write Educomp Computer Services at 742 Genevieve, Ste. D, Solana Beach, CA 92075.

Faster Mac-to-PC Connection

► Most of the less expensive Mac-to-PC connections are based on the AppleTalk Personal Network, which operates at 237,000 bits per second (bps), about 40 times slower than the much more expensive Ethernet.

QuickShare, from Compatible Systems of Boulder, Colorado, is a new Mac-to-PC connection. This product, which operates at 1.6 million bps, is some 6 times faster than the AppleTalk Personal Network because it uses the Mac's high-speed SCSI port—an important benefit when many large files must be transferred between Mac and MS-DOS formats.

QuickShare gives the Mac user full access to the PC's hard disks, floppy disks, and local area networks. It can also transfer compatible files between Mac and MS-DOS programs, as well as capture

text and graphics output from MS-DOS applications and input them into Mac page-layout packages.

QuickShare includes an internal board for an MS-DOS computer, a cable, and software. It works with the Mac 512KE, Plus, SE, and Mac II.

Mac II 300-dpi Color Printer

► Tektronix of Beaverton, Oregon, is offering a 300-dpi, four-color printer that prints any of 16.8 million colors and accepts QuickDraw output (a PostScript interface is under consideration).

Tektronix's Model 4693B parallel-input printer, available immediately, is priced at \$7995 plus \$495 for the Mac II interface card, cable, and software—considerably less than the PostScript-compatible QMS G650's expected price of \$20,000 to \$25,000.

Tektronix uses a thermal printer from an undisclosed Japanese company. This machine melts wax off a non-reuseable, four-color ribbon that will last for 275 copies. Each printed page costs 35 cents, and each overhead transparency costs \$1.25. Output speed is one page per minute. The image processor contains a 16-MHz 68020 processor and 4 megabytes of RAM (expandable to 12MB for \$4000).

Color correction is available from within the printer or through some of the Mac II's color paint and graphics programs. Tektronix's software includes a screen dump that can provide output for color matching in ten seconds. Image size is very close to 8½ by 11 inches when using an 8½-by-14-inch piece of paper.

Your Best Stacks

► Send a disk of your best *HyperCard* stacks to: News Editor, *Macworld*, 501 Second St., San Francisco, CA 94107. We'll pay \$25 for every entry selected for a new monthly item, "Your Best Stacks." Please tell us how you developed your stack, describe its features and who would use it, and let us know how readers can obtain more information. We'll also need to know if it's free, shareware, or a commercial product.

Dueling Spreadsheets

► To challenge *Microsoft Excel*, Lotus is developing a Mac version of *1-2-3*, which has become a standard spreadsheet in the MS-DOS world; the program probably won't be ready until later this year.

Microsoft announced that it will update *Excel* to version 1.5 in the first quarter of 1988 with color for the Mac II; customizable menu bars and dialog boxes; and multitasking support for Apple's Multi-Finder, which will allow the program to complete long calculations in the background while the Mac is used for other purposes.

A still later version of *Excel* will bring its functionality up to that of the MS-DOS version, which at press time was scheduled for release (November 1987). This later version will work with Microsoft's OS/2 operating system, which is a Mac-like, multitasking environment still under development. □

MacBottom Hard Disk Drives

The best gets better. Now our SCSI MacBottoms have a **2 year warranty** and are Macintosh II compatible! Choose from three models (HD21, HD32, HD45) and all are available with the optional MacBottom Modem. If you need an internal drive for your Macintosh II, our IHD144 is the answer. For 512K users we offer our MacBottom20 with serial interface. For details, call your dealer today.

For Macintosh Hard Disk 20 owners only!

If you own a Macintosh Hard Disk 20 with the external floppy drive interface you can now take full advantage of the Macintosh II, Plus and SE high speed SCSI port with PCPC's *HD-20 WSI (With SCSI Interface)* upgrade.

The PCPC *HD-20 WSI* provides a SCSI interface for *your* Macintosh Hard Disk 20 via an easy-to-install upgrade. In addition to a performance increase of 6 to 10 times and the ability to daisy chain up to seven SCSI peripherals, we provide a fantastic compliment of software, including HFS Backup, PCPC's popular archive and restore utility; Eureka!, the file finding desk accessory; and our ImageWriter and Laser spoolers.

The *HD-20 WSI* consists of a plug-in circuit board, interface cable, and utility software. It is designed for easy installation, as the circuit board uses the existing plug-in connectors and requires no soldering.

With PCPC's *HD-20 WSI* you can take full advantage of the power built into your Macintosh. The *HD-20 WSI* has a 1 year limited warranty and is priced at \$295.00. Don't let your hard disk be the weak link of your system, order your WSI today!

Sometimes A Picture Is Worth A Thousand Words.

It hasn't taken the desktop publishing world long to get the picture with scanners.

Literally overnight, people who haven't drawn anything but a paycheck since grade school have

been able to generate crisp, professional documents with first-rate photographs, illustrations, logos, and other graphics.

Our own PC Scan™ scanners are able to input images into your Macintosh™ Plus, Macintosh SE, Macintosh II, IBM® or compatible PC in seconds, and size and scale the image in the process. Then, with the help of Super Paint™ or PC Paintbrush™ Plus image editing software, you can annotate, crop and embellish images and ultimately transfer them into your desktop publishing program.

Likewise with photos. Up to 256 levels of true grey scale data may be scanned, providing unsurpassed image quality. And the print-outs are stunning, translating photos into high-quality images which can then be printed on digital phototypesetters or laser printers right on your desktop.

PICTURES ARE JUST
PART OF THE PICTURE.

We also scan words. Which happen to account for 80% of most documents.

And when you think about it, that may be an even more valuable asset than our ability to input graphics.

How do you currently enter existing documents into your system? Retype them, right? At 60 or so words a minute?

That's an incredible time drain when you consider that with our PC Scan family, you can scan

Then Again, Sometimes A Thousand Words Are Better

HOW TO STOP BLOWING YOUR TOP

add your own information.

And then transfer everything into your desktop program and start publishing.

Our desktop scanners read more business fonts faster than any other scanner. Including first-pass dot matrix, laser and daisy wheel.

And they're a snap to use, too. One lone keystroke begins operation instead of the multi-stroke formulas many scanners require.

WE WEREN'T
BORN YESTERDAY.

Although desktop publishing is a relatively new phenomenon, we're not exactly neophytes when it comes to desktop scanning.

For the better part of two decades, we've been producing the leading line of scanners for word processing systems.

A background that leaves us uniquely and

enviably situated to equal our success in desktop publishing.

If you'd like more information on our desktop scanners, call 800-538-7582 outside California. Or 408-946-7100 inside California.

We'd love to share a few words with you. Not to mention pictures.

DEST

an entire page of existing text in the mind-boggling time of 25 seconds, average. We read 600 words a minute.

And those words will appear on your screen the same way they do on the page. With the same tabs, same indents, same underlines, same everything.

Then you can take those words, edit them, change their order, fiddle around with the syntax and

New
VERSION 1.1

THE NEW YORK TIMES:

"MicroPhone is a breakthrough in communications software..."

LOS ANGELES TIMES:

"The program is more sophisticated and easier to use than any...on either the PC or the Mac."

MACWORLD:

"...brings together the best traits of every Mac communications program."

INFOWORLD:

"MicroPhone is the easiest communications package we've seen."

With reviews like these who needs advertising?

They say the best advertising is word of mouth. So we're reprinting some of the multitude of words that have already been said about MicroPhone communications software for the Macintosh.

And what they're saying, universally, is that MicroPhone—created by Dennis Brothers—has far outdistanced all its predecessors. That for the novice, MicroPhone is the simplest telecom software ever devised. That for the expert, MicroPhone is the most powerful.

On-line for the lazy.

MicroPhone gives you the means to create infinitely elaborate macro (automated) routines with infinite simplicity. Its powerful script language is written in plain English, and it also features a recording mode that watches, saves, and repeats what you do. So no programming skills are required.

The upshot is that MicroPhone will save you time, hassle, and on-line fees by automating virtually every operation you now

have to key by hand. Log on procedures. File transfers. And, for a good example, E-mail retrieval routines.

At a single command from you, MicroPhone will dial your E-mail service, give your ID number and password. Navigate its way through the labyrinth to your mailbox. Check for mail. Log off if there is none. And if there is, MicroPhone will collect, print, and save all messages to your disk. Then, politely log off.

Let's get technical box.

- | | |
|---|--|
| <ul style="list-style-type: none"> • 50 to 57,600 Baud • Supports XMODEM ASCII • 1K BLOCKS • MACBINARY • MACTERMINAL 1.1 • Emulates TTY • VT52 • VT100 • Capture file On/Off • Printer On/Off • Auto log on scripts for information utilities provided | <ul style="list-style-type: none"> • Scripts Invoked by Button Menu Command Key • Scripts have full logic constructs • Works with ALL Macintosh models & LaserWriter • Works with all async modems (Hayes included) • Includes Switcher & CompuServe subscription • Includes text editor licensed from Dreams of the Phoenix Inc. • Documentation by Neil Shapiro |
|---|--|

If you prefer, you can direct MicroPhone to initiate this sequence simply by inserting the disk. Or automatically, at any specified time, day, night. Or at regular intervals.

Anything else you need to do, from collecting stock quotes to sending and receiving files, is just as simple.

Try it out at home or office.

You can find out firsthand just what a remarkable program MicroPhone is. Without risking a cent. We give you a thirty-day moneyback guarantee, no questions asked. Which is virtually unprecedented in software.

Since MicroPhone is not copy protected, we obviously have vast confidence both in our program. And in you.

The Second Coming of Steve Jobs

■■■■■■ Steve Jobs-bashing is in vogue. And Jobs has turned into the Trotsky of high-tech. Grow up, everyone.

The Macintosh is four years old this month, or perhaps I should say four light-years old. We have seen galactic changes in the Macintosh universe since it was first introduced in Cupertino, California, on January 24, 1984, at Apple's annual stockholders' meeting.

I'll never forget the intense euphoria of that night. Inside the packed auditorium at De Anza College, it felt more like a rock 'n' roll revival—as if the Beatles were getting back together again—than a stockholders' gathering.

People were cheering as Apple co-founder Steve Jobs and Apple chief executive John Sculley made their presentations. Then Steve stepped up to the Mac, unzipped the case, turned on the machine, and it spoke to the audience: "Hello, I am Macintosh." Everyone went completely wild.

Macworld spoke that night, too. We were there with the first issue of the magazine. We had been working behind the scenes with Apple for over six months to create *Macworld* magazine. Here was our reward; we passed out thousands of copies to the frenzied audience.

Now the machine was the subject of a magazine "for the rest of us."

Lately, there's been a great deal of looking back at that early period when the Macintosh changed the face of personal computing forever.

There has been a deluge of articles on the subject, along with books like John Sculley's *Odyssey: Pepsi to Apple—A Journey of Adventure, Ideas and the Future* (Harper & Row, 1987), Lee Butcher's *Accidental Millionaire: The Rise and Fall of Steve Jobs at Apple Computer* (Paragon House, 1987), and most recently, the highly readable and fascinating *Steve Jobs: The Journey Is the Reward*, by Jeffrey S. Young (Scott Foresman & Co., 1987).

Most of the press has not been very kind to the man who was the driving force behind the Macintosh. There's been a wave of Steve Jobs-bashing and gloating over his corporate downfall from Apple. In a sense, Jobs has become the Trotsky of high-tech, the foremost ideological outcast of Silicon Valley.

Perhaps our culture, with its *People* magazine mentality, typically lionizes its heroes, then eats them alive. It's part of the food-chain of fame, I suppose. But it sticks in my throat nonetheless.

For example, in *Accidental Millionaire* Butcher (an appropriate name, by the way) writes that "the Macintosh was the first attempt Jobs had at creating a computer and it was a failure."

This cold and untrue statement smacks of historical revisionism at its worst. Even if the original Macintosh was not perfectly executed, it did, beyond any question, set the course for computing in the future—for all personal computing.

If you don't believe me, just look at MS-DOS machines today. You will see pull-down menus, *Windows* software, and icons, not to mention mouse pointing-devices.

When Apple introduced the Macintosh, there was a definite shift in innovation from IBM back to Apple. Earlier, when Apple was still riding high with its popular Apple II computer, IBM brought out its 16-bit PC and stole the thunder from the 8-bit Apple machine. The IBM PC offered more memory, and it had more speed and power. It set new standards for the industry.

Then, Apple introduced the Macintosh at about the same time that IBM brought out its ill-fated PCjr with its Chiclet-style

(continues)

Ultrasync.

You're looking at the new star
in display technology.

Actual unretouched screen image.

A screen star is born.

Introducing Ultrasync. The high-resolution, autosynchronous color monitor that's PC and PS/2 series compatible.

Ultrasync, with its exceptionally fine (.28mm) dot pitch, creates a picture of incomparable clarity. Capable of displaying infinite shades of brilliant color with striking contrast and dimension.

But the real beauty of Ultrasync is its versatility. It has the greatest autosynchronizing frequency range combination available with 45Hz to 120Hz vertical scan range (NEC's Multisync starts at 50Hz and peaks out at 75Hz) and 15KHz to 35KHz horizontal scan.

Plug Ultrasync into any IBM PC/PS series, Apple Mac II, or practically any computer system and it will adjust automatically to the standard you are using. There's no fiddling with switches or knobs. Our automatic picture sizing feature prevents display distortion and shrinkage. A simple built-in text switch is provided for your convenience. What's more, you'll enjoy the ease and comfort of Ultrasync's ergonomically advanced design.

Nobody but Princeton Graphic Systems could bring you an image with such star quality at a suggested retail price that's remarkably affordable. \$795. After all, we've been doing it all along.

PRINCETON
GRAPHIC SYSTEMS
THE VISIBLE EDGE

Circle 656 on reader service card

keyboard. The entire industry perception of personal computing changed once again, in favor of Apple. I firmly believe that this historical shift was the basis for Apple's tremendous performance in the market today. It also remains the foundation for the company's continued success.

Certainly, there were mistakes and miscalculations involved in the marketing and design of the Macintosh. But in no way is the Mac a failure, as Butcher alleges.

Steve Jobs told me he expected to sell 750,000 machines in 1984. It turned out that only 250,000 Macs were sold that year. Even so, this was an incredibly successful sales figure for a brand-new machine, with a totally different operating system, in a market dominated by IBM PCs and clones.

Among the Macintosh's winning features were its small footprint, its carrying case, and its graphics interface. I think those were all brilliant strokes. Even the machine's closed operating system, although it's been severely criticized, was not really an unreasonable idea—at least as far as Apple was concerned.

The Mac's architecture was designed so that all the software written for it would be standard. Developers wouldn't have to worry about multiple printers and various configurations the way they do in the MS-DOS world. Apple had put so much code into the ROM that it was impossible to clone the Mac the way MS-DOS machines were cloned.

In this way, Apple has been able to maintain better control over its machines. More important, it's been possible for Apple to keep prices high and retain better margins. That's only good business sense.

I was also a big fan of the fact that the Macintosh had no fan. A lot of criticism has been leveled at Jobs for not putting a cooling fan into the Mac. But I think that the ability to sit quietly with a computer that doesn't make a loud humming and rattling noise is a definite plus. It allows you to think more clearly and to be much more creative.

Just prior to the release of the original Mac, Andrew Fluegelman, founding editor of *Macworld*, wrote a memo that was widely circulated in the Macintosh division at Apple. In it, Fluegelman urged Apple not to bring out a 128K machine. He recommended waiting until the company was able to release a 512K Mac. Ultimately, as you may recall, Apple opted to unveil the 128K model.

Why didn't Apple bring out a 512K machine at the start? It required larger memory chips. And although the chips existed, they were not available in volume at a price that made sense at the time.

I think there was tremendous pressure on Apple to get the Mac out in time for its annual stockholders' meeting. Apple was so obsessed with turning that event into a major launch for its new product that it probably did itself a disservice by coming out with the 128K model.

In my opinion, the most serious mistake Steve Jobs ever made with the Mac was not in the actual design of the machine. The Mac's Achilles' heel was that it lacked the necessary third-party software support. It was not a technology problem but a personality problem. Jobs was so abrasive that he tended to alienate people—especially the software developers whom he desperately needed to woo.

At the original Macintosh launch, Fred Gibbons, president of Software Publishing, Bill Gates, chairman of Microsoft Corporation, and Mitch Kapor, president of Lotus Development Corporation, all stepped forward to announce that their companies would support the Macintosh with software. Of the three, only Bill Gates actually came through. In fact, he had several programs ready on opening day.

Software Publishing quickly abandoned the Mac. And it took more than a year before Lotus came out with *Jazz*, a program that proved to be a dismal failure.

By contrast, I think that one of the most positive achievements of Apple chairman John Sculley in the post-Jobs era is that he has taken great pains to mend broken fences. He has carefully built good relationships with the infrastructure of the personal computing world. Not just with the third-party software companies, but also with dealers, suppliers, journalists—the entire personal computing community, in fact.

Remember, there were and are a lot of people in the personal computer industry hoping that Apple would succeed with the Macintosh. The truth of the matter is that many industry leaders feared that IBM would come to own all of personal computing.

My friend Dr. Eddie Currie, president of the New York-based software company Lifeboat Associates, made dire predictions about Big Blue at the time. With the introduction of the IBM PC, he warned, personal computing had gone into orbit around IBM. "It's not clear if we'll ever have the velocity to escape that orbit," he worried.

One fear was that Big Blue was strong enough to kill any of its competitors. There was an added danger that innovation could easily be stifled, because no one would dare do anything that wasn't done the IBM way.

Furthermore, IBM was selling directly to many of its corporate accounts, a fact that gave dealers the jitters. Once IBM controlled the software, they reasoned, it would then control everything—including the kitchen sink and all its peripherals.

So there was a genuine receptivity to Apple. But Steve Jobs failed to capitalize on that ground swell of popular support.

Jobs's second biggest mistake was alienating the Apple II division by doing some really dumb things. For example, at the annual stockholders' meetings in 1984 and 1985, staff from the Macintosh division sat in the front rows while people in the Apple II division had to watch on closed circuit TV in another building.

Jobs passed over achievements of the Apple II team, even though Apple II sales were growing astronomically. They were actually bringing in all the company's profits.

Another mistake Apple made with the Mac was introducing it at too high a price. The 128K Mac sold for \$2495. This meant that the first wave of buyers were not the "rest of us," as Apple's advertising proclaimed. Rather, they were the personal computing enthusiasts who already owned three or four machines. They were the early adapters—always keen on acquiring the newest, the greatest, the latest thing. Definitely a small niche market.

I don't know what the price-per-unit cost was to market the Mac, but I feel certain that if the product had been priced at \$1995, Apple would have sold 750,000 units that first year instead of only 250,000. And the Macintosh would really have quickly become the machine "for the rest of us."

But a lot has happened since 1984. As the Macintosh goes into its fifth year, I see only good things ahead for Apple.

We're seeing a tremendous amount of innovative software emerging. Desktop publishing is booming. We're witnessing great CAD/CAM applications, as well as new and really good database products for the Mac.

I expect we'll see much more Mac technology develop in 1988—especially connectivity solutions, and more communications.

(continues)

NODE WARRIORS.

For many people, using their Local Area Network is like a journey across 500 miles of bad desert, with strange, unforeseen forces of destruction lurking behind every turn. Until now that is.

Because now there's TOPS, a revolutionary departure in LAN design. TOPS fully arms each node with local user control of information, and frees you from the grips of costly central file servers—and even more costly network administration personnel.

TOPS' unique design gives users completely transparent access to files anywhere from any operating system on any computer—anywhere in the network. And TOPS' modular design supports new operating systems as they become available. Users become believers, because TOPS is so easy to operate. All its commands are totally intuitive.

TOPS is also easy to install and support, and there's no downtime necessary when adding new users. You just plug them in. And because there's no central file server you avoid data crashes and bottlenecks. Your LAN will be stronger than ever, and faster too, because users communicate directly with each other.

Reinforcements!

TOPS Version 2.0 does everything the original does, then adds a few extras all its own. Like automatic publishing and mounting of folders and volumes. Access to locally attached PC printers by other networked PC users. Compatibility with Apple Filing Protocol, and FlashTalk™ speed (it's three times faster than AppleTalk in PC to PC communications). Translation of PC files to Mac format and vice versa. And a lot more.

And price? No need to worry, because it won't put you into deficit spending. TOPS is just \$189 per node for Macintoshes and PCs.

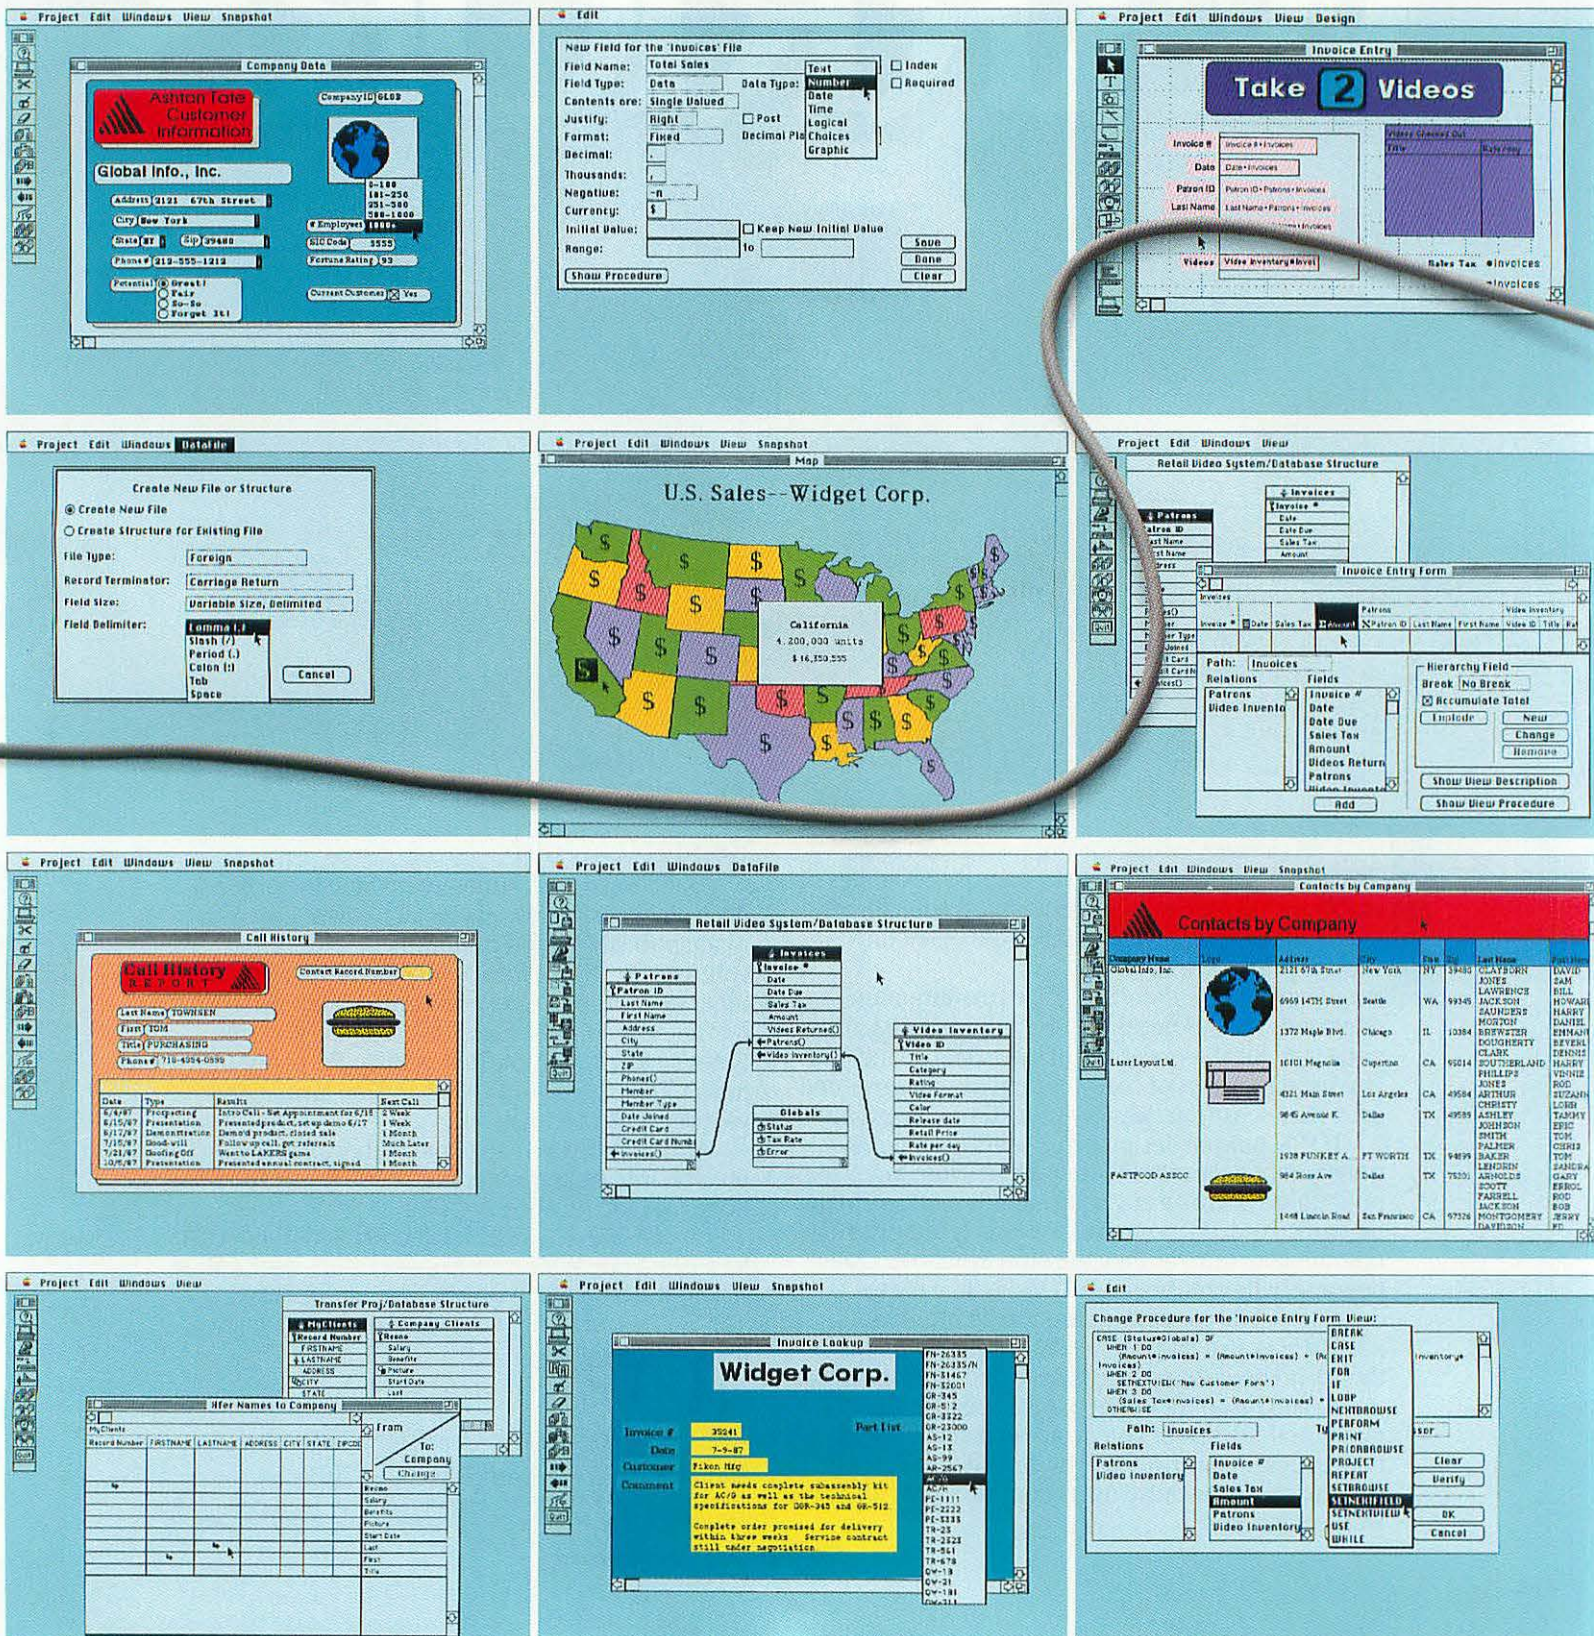

So call 800-222-TOPS (US), 800-445-TOPS (CA), for a free Node Warrior button and more information. It'll tip the balance of power in your direction.

Ashton-Tate ann powerful database ever

ounces the most used by man or mouse.

It's called dBASE® Mac.

And it's the most powerful relational database designed for the Macintosh™.

Especially since, unlike other databases, you can get that power without knowing a thing about programming.

Begin by creating and relating your files.

Not just linking them,

but relating them. So when you update one file, all your related files will be updated. Automatically. Immediately.

And remember, with dBASE Mac you can do all this without programming.

With a few clicks of your mouse, you can quickly redesign and rearrange your files to look at your data in any number of ways. Without disrupting it.

And without any programming.

Also using the selection of fonts and MacDraw®-like tools, you can design reports from the very simple to the very sophisticated. Right on the screen.

So you'll know how it looks before you print it.

We're not talking about just text and graphics. With dBASE Mac, you can incorporate photos of people, parts and places into your database.

You can even import data from Ashton-Tate's dBASE III PLUS™, dBASE III®, or dBASE II®, as well as ASCII files.

All without programming.

And all with the help of Macintosh's on-screen prompts and pull-down menus.

But if you want to go still deeper, the powerful dBASE Mac programming language will take you into a world of power and capability where no Macintosh has ever gone before.

If you would like a demo disk for \$4.95*, or the name of the dealer nearest you, call (800) 437-4329, extension 2400.** You'll see how this Ashton-Tate relational database will

make your Macintosh office work smarter.

Whether you are a huge organization.

Or a one-mouse shop.

'Mac-Type People'

Steve Jobs kept changing his mind about appearing on *Macworld's* first cover. Finally, we got him to pose for 30 seconds. Later, he had us change the images on all the screens of the Macs. Then he called to say he didn't want to be on the cover after all. We told him it was too late and the issue was already at the printer's, which, of course, it wasn't.

We had set up a secret office inside the *PC World* building to work on *Macworld*. We took over the conference room and papered over the windows so that no one could look inside. And we put special locks on the doors. Inside this operations room, we had a team of five *Macworld* staffers working away on two 128K machines. It

was a six-month project that culminated in the release of the magazine at Apple Computer's annual stockholders' meeting on January 24, 1984—the night that the Macintosh was launched.

Winning Apple's trust and confidence was a close call for *Macworld*. Andrew Fluegelman, the magazine's founding editor, and I visited Apple to make a pitch to publish a Macintosh-specific magazine. We weren't the only ones to make a proposal. Our competition had been there earlier with an elaborate presentation—charts and graphs and slides, and all kinds of pizzazz. But Steve Jobs and Mike Murray, marketing director of Apple's Macintosh division, picked us to create a magazine for what we knew would be a large and passionate audience of Macintosh users. We were "Mac-type people," they said. We took that as a high compliment then, and we still do.

My fondest wish for 1988, though, is that John Sculley, Apple, and Steve Jobs will bury the hatchet.

We've had enough Steve-bashing. I say, give the guy a break. It's difficult to imagine anyone going through so many changes, and becoming so powerful so fast, without having to make some basic character adjustments.

All that Steve really needs to do in order to answer his critics—and what he's likely to do this year—is to bring out his new NeXT computer. I think it will probably set new standards, new directions, and new trends for personal workstations.

Steve Jobs is a technological innovator and an implementer. His greatest skill is not inventing new technology. We're all aware of his shortcomings as an engineer. So what? His gift is finding existing technologies and integrating them in a new package that becomes easily accessible to the widest number of users.

Ultimately, he has been the catalyst for changing the direction of personal computing.

The mouse, *Windows*, pull-down menus, and the graphics interface were invented at Xerox PARC. Steve Jobs and Apple did not invent them. But it was Steve Jobs and Apple that made them what they are today. If Steve hadn't reached out and grabbed those ideas, they would have withered away in some R&D lab, just so many useless and unused experiments.

I suspect that at NeXT, Steve will bring in some components and technologies that we haven't seen packaged before in personal computers. As usual, he will probably do that in interesting ways that will raise the stakes of personal computing.

Some industry insiders have sarcastically predicted that the NeXT machine will be a "super-yuppie machine" with great graphics and sounds, and that's all. Whatever it may be, I look forward to it with great eagerness. Because I will wager that when the NeXT workstation does come out, suddenly people will be amazed by Steve Jobs all over again. The fickle media will become more sympathetic, and they'll start to build him back up to his former glory. Perhaps no longer as a wunderkind, but a wundermensch.

I hope that from all this turmoil a new Steve Jobs will emerge—a more grown-up and diplomatic person. We may actually witness his second coming in 1988. But I don't think that this triumph means he is going to eclipse Apple. Apple will continue to be successful, huge, and magnificent. Steve will be a winner in his own right.

Jobs's critics may truthfully declare that Sun Microsystems and Apollo Computer invented the workstation, that they laid all the technological groundwork. But Steve Jobs will be the one who plays a major role in making workstations popular and accessible for the rest of us.

He will be the Merlin who gives workstations imagination and transforms them into the machines of the nineties and beyond.

Rest assured, Steve Jobs will be back one day soon. We still need him. He still needs us.

Have an insanely great 1988! □

***"Can you believe it? Our team got picked
for the hottest project of the year
because they found out
we do all our work on Sony diskettes."***

The fast-moving, fast-thinking people in today's competitive corporate world are the people pushing for the highest standards. For example, Sony diskettes.

People in the know, know that Sony's standards are the very highest. That, after all, is what made Sony a world leader in audio, video and computer magnetic storage media.

But selecting Sony also shows solid business sense because we invented the revolutionary format for the

3.5" drive and 3.5" floppy.

So we simply have much more experience than anyone else at making and perfecting 3.5" floppy disks.

Think of it this way: when your reputation's on the line and you've put your very best into your work, you want to be sure that your floppies are every bit as good as you are.

The way to do that is to make sure they're Sony.

Then you'll be in the very best of company.

SONY®
THE ONE AND ONLY®

WordPerfect
for the Macintosh

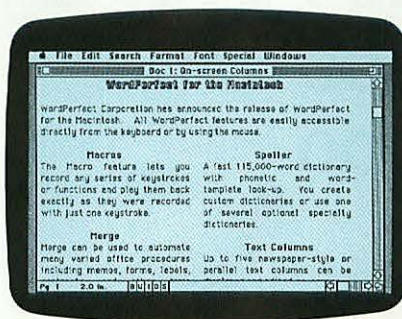

WordPerfect's new arrival that wasn't born yesterday.

WordPerfect for the Macintosh has just arrived, and with it comes a whole new era in word processing for the Mac.

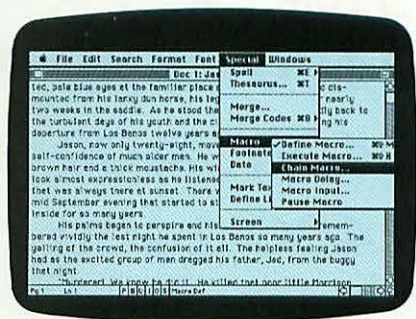

Yes, it was a long time coming. But a sophisticated word processor

doesn't just drop from the skies. It takes time. Time to create a true Mac mouse interface that also has the built-in versatility of keystroke equivalents in main menus and submenus. Time to implement exclusive WordPerfect features such as on-screen text columns,

(Left) Create up to 24 on-screen text columns, with snaking or screen-writer column options. Put them anywhere in your document, any time you like. (Right) Store the tasks you do frequently—with no limit to number or size—and call them up instantly via mouse or simple keystroke commands.

automatic formatting, document compatibility, a fully integrated thesaurus, and a dictionary that's 115,000 words strong.

Check out our great new arrival. The proud culmination of painstaking research and responsiveness to user needs. The only serious word processing software that's truly fit for a Mac. For more information call or write WordPerfect Corp., 288 West Center St., Orem, Utah 84057 (801) 225-5000.

Cattle Call

Cattle ranching, like all agriculture, needs the high-tech capabilities of the Mac; unfortunately, I've had trouble locating any live-stock-management packages. Could you furnish a list of suppliers?

James A. McAllen
Linn, Texas

The Macintosh Buyer's Guide lists two suppliers of agriculture-management packages: Hutchinson Computer Industries in Minnesota (612/587-2940) and Dapple-Tech Computers in Maryland (301/490-1200). Data Sources lists AG Plus Software in Iowa (712/364-2885) and Digipac in Saskatchewan, Canada (306/765-1707). Heizer Software in California (415/943-7667) sells an Excel template for swine management.—Ed.

Corrections

MacLink Plus suffered a case of mistaken identity in Commentary and in "Business Buyer's Guide" in the November 1987 issue. The file-conversion program is published by DataViz of Norwalk, Connecticut, 203/866-4944. MacViz is a real-time video digitizer made by Pixelogic (formerly Microvision) of Stoneham, Massachusetts, 617/438-5520. Our apologies for the confusion.

Our August 1987 Updates contains a listing for Trapeze 1.1, which was never actually released. The current version, 2.0, has been released and is described in this month's Updates.

The address for Diehl GraphSoft (Updates, August 1987), maker of MiniCad, is 8370 Court Ave. #202, Ellicott City, MD 21043. The price for registered users is \$19; \$495 suggested retail price.

Rare First Edition

As someone with seven years of experience in the printing and graphics business, I think "First Edition" (August 1987) is the best single article I have ever read for preparing people to deal with printers. Pointing our customers to the article as a primer saves us hours of explanation.

Richard R. Hausfeld
Madison, Wisconsin

The Printer Sees Red

"First Edition" contains enough inaccuracies to cause consternation in the printing community. Some examples: "The camera reads red as black." Many electrostatic camera-platemakers are more sensitive to blue. "Presses do not print to the edge of the sheet." Maybe not a sheet of maximum size, but they can bleed three

sides of a smaller sheet. "Paper costs can constitute as much as 50 percent of your final printing bill." A good grade of offset paper should account for only 8 to 18 percent.

And don't worry about getting burned by a hand waxer—mine heats wax to about the temperature of warm tea, and I have resisted the impulse to wax my hands for nearly 14 years.

H. B. Smith
Pronto Print, Inc.
Bristol, Rhode Island

Suzanne Stefanac responds: "Several printers and seasoned publishers I've interviewed said they've seen paper costs go over half the budget. As for bleeds, I merely cautioned new publishers to consult with printers before doing one, particularly when it falls on the top of a page, since that's usually where the press grips the page."—Ed.

Would you leave this document out on your desk?

Then why leave it unprotected on your disk?

Everyone creates confidential documents — payroll analyses, bids, personnel records, to name a few. But documents sitting on the Mac desktop are as vulnerable as papers left out on your desk. Anyone can access your files when you are not around. And with the increased use of hard disks and networks, your data is now more accessible than ever. You need a way to guard your private documents from prying eyes.

SENTINEL: Password Protection and Encryption.

SENTINEL is a data encryption utility that lets you lock your documents right on your desktop. Since password protection is easily circumvented by the determined intruder, Sentinel uses password and encryption strategies to protect your documents.

For encryption (which actually scrambles the data on your disk), Sentinel presents a choice of two methods: *DES* or *SuperCrypt*™. Both offer speed as well as security. Our DES encrypts a 100K file in less than 90 seconds, SuperCrypt in just under 5.

Standard Macintosh Format.

Documents encrypted by Sentinel remain in standard Macintosh file format. They can be backed up, copied, transmitted over networks, or sent to remote sites by modem. But unlike all of the other files on your desktop, they can be unlocked and read only by someone possessing the correct password.

Sentinel's two encryption methods, DES and SuperCrypt, are so fast, they leave the competition in the dust.

Easy and Natural to Use.

Sentinel also makes working with your secured files more convenient. Creating Sets of files allows you to protect multiple documents efficiently. You can add or delete documents to a Set, and Sentinel will lock or unlock them all with one password.

The *WorkSet* feature remembers which files have been opened at any time during a work session, and gives you a quick lock-down capability. Sentinel was designed to be unobtrusive and easy to use, making file security a natural work practice.

Price: \$295.00.

Minimum system requirements:
Macintosh 512e

SENTINEL. Because it's not a personal computer anymore.

Letters

Flawed Performer

I was outraged to discover that several advertised—and fully documented—features were not implemented in Mark of the Unicorn's *Performer* 2.1 upgrade. Enclosed in the promotional material urging registered users to buy the upgrade was *Macworld* author Christopher Yavelow's glowing review of the product, which has considerably lowered my faith in his objectivity and reliability.

Mark W. Phillips
Athens, Ohio

Christopher Yavelow responds: "I granted Mark of the Unicorn permission to quote my review after publication. Because of space limitations, the review was never published so I was surprised to learn it had been quoted. However, the prerelease version I tested was, for the most part, fully functional. Although some features were later disabled for the 2.1 release, the product's accompanying letter acknowledged this and promised buyers they would soon receive a fully operational update." Yavelow has since received a copy of Performer that conforms to the one he reviewed. —Ed.

Sounding Off

I was excited to see our *Sound Lab* waveform editor for the Ensoniq Mirage reviewed in your July 1987 issue. Although the review was quite positive, Erik Holsinger thought the product too expensive and the manual inconsistent with the program's newest features. Since then we have fully updated the manual for our latest version (1.2) and have reduced the price from \$399.95 to \$299.95. We just wanted you to know we're listening.

Donny Blank
Blank Software
San Francisco, California

Default Finding

I realize your review of *miniWriter* in the September issue couldn't go into detail about its defaults, but the Smart Quotes feature is one of a number of options, including font and size, that can be permanently set. Admittedly, configuring the defaults requires *ResEdit*, but the process is detailed in the documentation.

David Dunham
Maitreya Design
Goleta, California

QUALITY PRICE.

(Quality and price are inseparable at Warp Nine.)

The Photon 20, 30, 40 and NEW 80

Our best selling products are 21, 31, 41 and 80Mb external SCSI hard drives. MacUser says "The Warp (Photon) 20 delivers excellent value" and "The support from the manufacturer was very good." Feb. '87.

- All drives are fan cooled moving air through the drive front to back, not out the bottom where it will heat your drive, unlike our competition.
- Auto head parking to insure that data is safe while transporting.

Introducing Three New Internal Hard drives for the Mac SE.

Buy a Mac SE with two 800k floppies. Then install our internal hard drive in place of one of the 800k floppies. Takes 15 minutes. Gives you a hard and floppy drive for hundreds less than Apple.

Features that Apple doesn't offer:

- 4 shock mounts to absorb the bumps of everyday use.
- Pushbutton SCSI addressing

P20i (20 Mb)—**\$499.00***

P30i (30 Mb)—**\$649.00***

P45i (45 Mb)—**\$899.00***

*This price includes a rebate of \$100.00 if you return the 800k floppy drive to us in our pre-supplied box. P20i, P30i and P45i without rebate \$599.00, \$749.00, \$999.00 respectively.

THE PHOTON 20, 30, 40 AND 80 Hard Drives

THE PHASER 800 Floppy Drive

MAC II 50 AND 80Mb INTERNALS (The same drive Apple uses)

MAC SE INTERNAL HARD DRIVES

For 512k Owners.

All our hard drives and tape drives work with your 512k enhanced. Just add our easy to install Plusport SCSI port adapter. **\$139.00**

Photon 2001

The 2001 is a combination 20Mb hard drive/20Mb tape drive. MACazine said our tape backup "software is topnotch and simple to use, the benchmark times are very good and the drive is quiet."

\$1399.00

Phaser 800

MacWorld described it as "So quiet it would be unobtrusive anywhere except a library on Friday night." (Nov. 86) Works with 128, 512, MacPlus, and SE.

\$199.00

Mac II 50 and 80Mb internal hard drives

We use the same Quantum drive that Apple installs. Comes with everything you need to mount into your Mac II in less than five minutes. Why pay more for the same product?

**The hottest sport
on a court –
the hottest game
a Macintosh™ can handle.**

Even if you've never been on a racquetball court, you'll spark to the excitement of this challenging simulation.

MacRacquetball turns your Macintosh screen into a full perspective 3-D display of court, players and ball. With the mouse, you have complete control of player position, ball placement, ball speed and shots. Two people can play the same game over AppleTalk® or modem.

Superb graphics give MacRacquetball completely convincing realism. There are more than 1000 frames of ultra high speed digitized animation. It's one racquetball court that's always open when you're ready to play.

**Enthusiastic players
everywhere have made
MacGolf the best selling
Macintosh game ever.**

MacGolf puts you in the picture, a full perspective 3-D simulation of realistic golf action. You match your skills against fairways, roughs, bunkers, water hazards, sand traps and trees.

MacGolf gives you a player's eye view of the course, in any direction, and an aerial overview of each hole. You have complete control of your position, ball placement, ball speed and direction, and selection of all 14 clubs. Digitized graphics and sounds add to the excitement.

MacGolf is so close to the real thing it will improve your golf game. And by the time you've reached the eighteenth hole you'll know you've been in a real contest.

**When you have
the best selling Macintosh
game in the world,
what do you do for an encore?**

Here's new turf for adventurous MacGolfers. These are courses to conquer for mouse wielding pros who have taken the measure of the original MacGolf courses.

If you liked MacGolf, you'll love what MacCourses brings to the screen. Four new 18 hole, par 72 courses: Cedar Creek, Golden Sands, Thunder Ridge and PCAI International. The fairways, traps, hazards, and putting greens of MacCourses are in a whole new league.

If you thought MacGolf was good training for the outdoor game, MacCourses should turn you into a pro. Get MacCourses now, use it when you're ready – you never know when you'll need the challenge.

Restricted Access

In the September 1987 issue of *Macworld*, David Bunnell revealed that the FCC is eyeing an "access charge" that would directly affect individual users, who can least afford it. I oppose this punitive surcharge and concur with Bunnell's suggestion that the FCC start a bulletin board so that it can run a more "open shop." Rather than free up the marketplace, enacting this proposed fee would represent a move in exactly the opposite direction.

Collis Davis
Brooklyn, New York

Data Exchange

Many mainframe databases can read and write ASCII files. Why don't Mac databases provide this feature to aid import and export of data to and from other programs?

Duane D. Kiser
Aiken, South Carolina

Our database expert Jim Heid answers that virtually all Mac database managers—from simple filers like Record Holder Plus to relational development systems like dBase Mac and 4th Dimension—can exchange data with other programs via ASCII (text-only) files. FileMaker Plus can read and write tab- or comma-delimited text files, while dBase Mac reads and writes text files with fixed or variable-length records and supports six different field-delimiting characters. As a mainframe user, you might want to examine Odesta's Helix VMX, a VAX-based version of Double Helix that provides access to databases for networked Macs.—Ed.

Sales Pitch

The letter in your August issue from Ted R. Swanek asking about software to record sales leads prompted us to respond. We designed C.A.T. with this very idea in mind, to track business contacts. I hope it will benefit other frustrated salespersons who want to use the Mac more effectively.

Debbie A. Bartunek

POWERFUL TIME BILLING & MAIL LIST FOR YOUR MAC!

LEGAL BILLING

Legal Billing is a time billing package designed specifically for attorneys and accountants. **Legal Billing** is a full featured system, and yet it is incredibly easy to use. Most firms are up and running in 30 minutes or less!

Here's what **Legal Billing** can do for your office:

- ▶ Allows simple and fast entry of information, automatically sorted by date, client, employee and activity
- ▶ Customized productivity reports
- ▶ Automatic interest added to past due balances
- ▶ Client statements formatted in most any way
- ▶ Multiple billing rates for each employee
- ▶ Aging Report can be customized
- ▶ True Work-In-Progress feature holds activity details from month to month

\$595.

LEGAL BILLING II

Legal Billing II is an easy-to-use, advanced system designed for small to medium size firms. Includes all features of the basic system plus much more!

- ▶ Full trust account reporting
- ▶ Archiving of billed services and costs
- ▶ Additional billing options
- ▶ Handles more employee and activity codes
- ▶ Multi-user option available

\$895.

\$1295. Legal Billing II +

NEW
from Satori Software

PROJECT BILLING

Project Billing is a time billing package designed for ad agencies, graphic designers, architects and engineers. This package will track all aspects of your project billing including budgets for time and expense, actual costs and billed out amounts for both employee and expenses, and project profitability.

It will also automatically mark-up expenses, and provide productivity reports by employee or project, plus print your client bills in a variety of formats.

This is how **Project Billing** can help you office:

- ▶ Tracks employee productivity by cost and billable rates
- ▶ Automatically marks up expenses
- ▶ Provides profitability analysis by project
- ▶ Tracks budgeting of time and expense
- ▶ Prints bills and adds interest
- ▶ Work-In-Progress holds detail from month-to-month
- ▶ Enables progress (partial) billing, while holding all detail
- ▶ Multi-user option available

\$695.

\$1095. Project Billing +
- Multi-user version

BULK MAILER

NEW VERSION! **Bulk Mailer** is a powerful program specially designed for managing lists. **Bulk Mailer** does everything you want in a mail list program, including duplication elimination, zip and alpha sorts, 1 to 4 up labels printed, easy-entry defaults, multiple label format, plus, much, much more.

This is the only program to offer all these features.

- ▶ Duplication elimination
- ▶ Zip or alpha sort
- ▶ Car-rt sort or zip + 4
- ▶ 1 to 4 up labels or roster format
- ▶ Powerful coding capabilities
- ▶ Sophisticated global editing and deleting
- ▶ Mail merge with Microsoft Word
- ▶ Easy-to-use entry defaults
- ▶ Coding and date expiration fields
- ▶ Large record capacity (up to 90,000 names)
- ▶ Hard disk compatible

Now shipping version 3.0

\$149. Bulk Mailer
- up to 8,600 names

\$350. Bulk Mailer +

Write from

When it's time to start putting words on paper, Microsoft® Write is the right place to start. Because no comparably-priced word processor gives you as many features. Or an easier way to get at them.

If you already own a Macintosh™, you already know how to use Microsoft Write. Because it shares all those great Macintosh qualities. Like comprehensive, pull-down menus. And familiar point-and-click operation.

But don't worry if you've never made friends with a mouse before. Microsoft's exclusive on-line context-sensitive Help puts the answers to most of your questions a mere button push away.

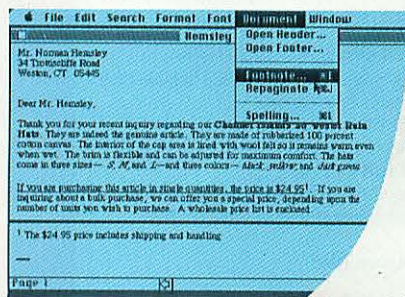

Microsoft Write's 80,000-word, customizable dictionary helps our built-in spelling corrector make all your words letter-perfect.

Plus you get all the documentation and telephone support that's helped make Microsoft's family of products the most popular of all Macintosh applications.

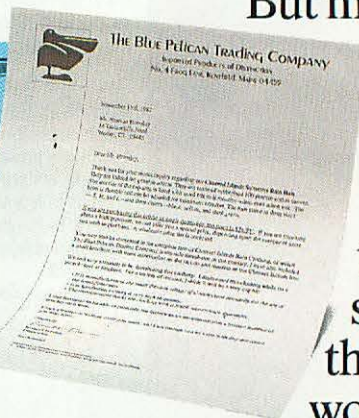

But making it easy to get your words on paper is just the beginning.

For example, thanks to a built-in spelling corrector, those well-chosen words of yours will all be impeccably spelled. And, thanks to another innovative feature, properly placed as well.

Because the page preview command offers you the unique opportunity to examine your work a miniature page at a time. So you can review, and revise, all those little factors that make the difference between a good-looking document and a great one.

Teamwork at work. You supply the words, Microsoft Write supplies the footnote number and location.

Team Microsoft Write with a LaserWriter™ printer and your words

the start.

Like where pages break and margins fall. And how the headers and footers lay out.

What's more, with advanced features like automatic footnotes, newsletter-column formatting, and the ability to mix text and graphics on the same line, Microsoft Write adds authority, and clarity, to all types of writing. With about as much effort as it takes to dot an i.

But Microsoft Write doesn't stop there.

As your word processing needs grow, you can always take advantage of the powerful,

AAAAAAA

can stand as tall, or as small, as you'd like.

processor, Microsoft Word, Version 3.

Without going back to page one.

In addition to using your existing files, Word uses the same commands as Microsoft Write.

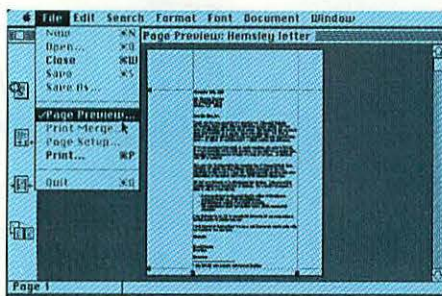

And then adds incredible features and flexibility to them. So the time you invest with Microsoft Write won't be wasted.

And neither will your money. All registered Microsoft Write owners can upgrade to Word at a special, reduced price.

Before it's time to face up to the infamous blank page, call (800) 541-1261, Dept. C73, for the name of a Microsoft Write dealer near you.

Trust him to give you everything you need to get your writing started.

Except, perhaps, an opening line.

With Microsoft Write's page preview command, what you see on the screen is what you'll see on your paper. Line after line after line.

Got a question? Microsoft Write's on-line, context-sensitive Help gives you the answer. Right on the spot.

Microsoft Write

Letters

acknowledged the problem but could supply neither a fix nor a workaround. Please alert your readers so that they can save themselves some headaches trying to debug correct code that's executing in an incorrect compiler.

Keith R. Barker
Mountain View, California

Borland says it has since fixed the problem in an upgrade and has been sending out free replacement disks to users who've reported the bug. —Ed.

The Great SE Debate

As an Apple dealer, I must refute Steven Levy's claim ("Macintosh SE: The Great Compromise," *Macworld* September 1987) that the SE's slot is not needed because dealers can connect circuitry to the Plus. While it may take ten minutes to install a board in the SE, in the Plus it can take hours. Levy laments the high cost of an upgrade if and when the SE begins to use the 68020, then says Apple should have boosted the price by including it in the first place.

Further, the SCSI port speed and the 15 to 20 percent increase in operating

speed are more than just "a little faster." Levy is finding fault where there is no fault to be found.

Robert L. Hyde
Coon Rapids, Minnesota

Tarnished Magic

To update your review of our MagicDrive hard disks (*Reviews*, September 1987): the drive's new software does include a head-parking utility, and some time ago we extended our six-month warranty to one year. In addition, we object to the MagicDrive's comparison to the SE's internal hard disk, since our drive was tested using a Mac Plus, which is slower than an SE.

John Kinnaird
MacProducts USA
Austin, Texas

All comparisons—except the one with the SE—were against other drives tested on a Plus. Incidentally, the time-to-duplicate test using the Jasmine 80 drive showed a minimal 8 percent speed difference between the Plus and the SE. —Ed.

North of the Border

Are there any Mac user groups in Canada that distribute public domain software?

Mario Bellabarba
Sherbrooke, Quebec

The only group we found was Apple Canada in Markham, Ontario (416/477-5800). Perhaps that group can put you in touch with others we don't know about yet. —Ed.

Rough Draft

SuperSpool 4.0 has some nice features, but it doesn't do draft mode. Is there a conservation-of-bugs law? It seems that Microsoft has fixed its draft-mode bug at about the same time SuperMac has found a new one.

Jerry DaBell
via AppleLink

WE HAVE THE BEST VIEW OF THE MACINTOSH WORLD: 1664 x 1200

S I G M A D E S I G N S

When they say a picture is worth a thousand words, they're describing LaserView™ ultrahigh-resolution large-screen monitors from Sigma Designs.

Available for the Macintosh™ SE and Macintosh II in 15-inch and 19-inch sizes, LaserView provides a 1664 x 1200 on-screen pixel display (equal to 11 Macintosh SE screens). And because

LaserView is a noninterlaced monitor, text and graphics are displayed virtually flicker-free. Even facing pages.

You can select the default display mode of 1664 x 1200 pixels (2,000,000 pixels). Or choose the standard Macintosh resolution of 72 dots per-inch which yields an on-screen pixel resolution of 832 x 600 (500,000 pixels). You can choose from three cursor sizes and two system font sizes for legibility.

For more information on LaserView, call Sigma Designs today at (415) 770-0100. Or visit an authorized Sigma Designs dealer.

Because for computer-aided engineering, advanced desktop publishing and anything in between, LaserView offers you a totally new point of view.

"SIMPLY PUT, CIRRUS DRIVES ARE A JOY TO WORK WITH!"

"These are powerful drives with powerful software."

"Using Cirrus drives gave us an appreciation of the importance of ergonomic design to performance."

"Cirrus drives are quiet and easy to work with...a plus to their performance rating."

"Very small and lightweight, (Cirrus drives) are constructed of quality materials designed to last."

"The Cirrus drives have the most exciting, simple and elegant design we have seen in a hard drive for the Macintosh."

Michael Day
The Macintosh Journal

The Macintosh Journal

Cirrus Drives

The Cirrus drives are exciting and excellent performers. They offer impressive speed, flexible software, attractive design and quiet operation.

Ease of Use

Running a Cirrus drive is very simple. It is just a matter of plugging the drive in and turning it on. The drives come pre-formatted and ready to go. The Cirrus has two DB 25 connectors on its case, so its cables are easier to work with than the "standard" SCSI cables that come with some drives. The design of the Cirrus drives contributes greatly to their ease of use.

The software that comes with the Cirrus drives is very flexible. It follows the Macintosh interface closely, and is well done. With the software, users can partition the drives into several volumes, or combine several drives into one single volume. Volume sizes can be changed or new ones added at any time without losing data. Password protection, manual or automatic mounting, automatic head parking, backup utilities, and disk repair utilities are all standard. In addition, the software performs several diagnostic tests including the ability to map out bad sectors and program the drive's interleave. In short, this is some of the most extensive and best written software available for Mac hard drives.

Most of the Cirrus' flexibility comes from their excellent software. However, the physical construction of the drives also contribute to their superior flexibility. Unlike other drives for the Mac, Cirrus drives can be placed vertically or stacked horizontally depending on your desktop requirements.

Performance

Cirrus drives were engineered to perform well in everyday situations. These drives are very fast when performing common operations such as going to the chooser or building the desktop. Reading and writing to and from files is also very fast. Using the Cirrus drives gave us an

appreciation of the importance of ergonomic design to performance. For instance, fan noise can increase fatigue in office workers. A drive that is built to be quiet and easy to work with may not increase the data transfer rate, but it will help to get more productivity out of the user. Cirrus drives are quiet and easy to work with which we consider to be a plus in their performance rating.

Because the Cirrus software is so good, users may want to use it to initialize drives from different manufacturers. In our tests, this worked well, and allowed drives of differing origin to be linked together as one volume. Since many of the older SCSI drives came with poor software, this is a good argument for buying a Cirrus drive and chaining it with other drives after they have been initialized with the Cirrus software.

Design and Construction

The Cirrus drives, though very small and lightweight, (about 4 lbs.), are constructed of quality materials designed to last. Their light weight is due to the small number of components in each drive and to their plastic case. The Cirrus drive is both sturdy and durable; the internal power supply is encased in aluminum, and the drives are shock mounted on rubber bearings.

The Cirrus drives have the most exciting, simple and elegant design we have seen in a hard drive for the Macintosh. The modular construction of the drives means that any repair work will be quick and easy. Simply put, Cirrus drives are a joy to work with.

Recommendations

Cirrus drives were designed for the professional user. They were not engineered to be low cost products, or to be "just adequate performers;" they are built with premium components. These are powerful drives with powerful software. Cirrus drives are an excellent solution for users who demand a lot. Readers should also note that several new products are in the pipeline and that a 40MB tape backup and 30MB hard drive are currently available. We give the Cirrus 20, 40 and 60 drives an excellent rating (8 on a scale of 10) and recommend that other drive manufacturers follow the Cirrus example, and design drives that are simple, elegant and impressive performers. -Michael Day

Thanks for the Memory

It's MultiFinder! Do you know where your memory is?

"It quit."
"What quit?"
"Excel."
"Excel?"

This, I thought, does not bode well. A newly upgraded Mac Plus with a large screen, running the latest version of MultiFinder, sits on the desk of Jane Lagas, our Editorial Manager. She uses it for budgeting, planning, author contracts, and more. Thirteen megabytes worth of information. This is a machine that we cannot afford to have acting up.

"Ah. Maybe it's MultiFinder."

I pull down the Special menu, and select Set Startup. So far so good. Select the Finder option in the dialog box. Then restart. No icon in the upper-right corner, so we're in the Finder. And, yes, *Excel* opens up. Talk about a rude awakening. A Mac Plus upgraded to 2MB cannot run MultiFinder and *Excel*.

True, *Excel* is a notorious memory hog. True, Jane does run large spreadsheets on her system, and the display screen needs sufficient RAM to support a full 1024-by-780 screen buffer. But the implications.

I had only just managed to convince my management that we needed to have several of our Mac Pluses and Mac SEs upgraded to 2MB. Eleven upgrades. We managed to buy the memory for about \$6000. (We bought the memory from an Apple developer, before Apple had lowered its price for 1MB to about \$599.)

Incredible. Two megabytes is not enough. Not that 2MB has any particular connotation, but I had thought we'd be "power users" with that amount.

I already knew that 2MB on the Mac II is insufficient. For our first demonstration of Interleaf's electronic publishing program for the Mac, the company had to bring 4MB of memory to add to our Mac II just to show us the package. I also remember the demonstration of Microtek's new 8-bit scanning software that wouldn't work properly with only 2MB. Then there's my trouble with Bravo's *MacCalc*, the spreadsheet that I use for planning; it quits frequently—"Out of Memory."

Come to think of it, SuperMac's *Pixel Paint* does something similar, but less rudely. When I try to launch the program on my machine, I get a dialog box politely informing me that there is insufficient memory to use the package, but would I like to open it with the memory available? At least I can use the program. On the other hand if I try to open a large picture file, the program opens only the application, not the picture.

Having faced the fact the the Mac II is a 5MB-base machine—that is, it needs that much memory to run many of the new programs I try—I could accept a 2MB minimum for the Plus and the SE. In fact, I noted in this column a month ago that the Plus/SE family was moving to a 2MB base. Finding that even this amount may be insufficient was frightening.

There are several implications, but for the first time as an administrator I was facing a very contentious issue. How can I afford to upgrade the memory of the 20-plus Macintoshes in our department? And if I do, is 2MB enough or do we need more?

Of course, memory sellers should be in heaven.

But wait. Do I recall a demonstration of MultiFinder that showed how to minimize the amount of memory used by applications? I plow into the documentation (blissfully straightforward). It says to open

the System Folder and select About Finder. (It never says MultiFinder in the About box, even when you're using MultiFinder.) A little chart pops up that tells me how my system's memory is distributed: 224K to *WriteNow*, 160K for the Finder (I assume this is the combination of the Finder and MultiFinder), and 409K for the System.

A good start, but is there actually a way to indicate how much memory I must dedicate to each application? Read on. If you select an application while in MultiFinder and then request Get Info from the File menu, an updated dialog box opens up showing two new entries: the amount of memory Apple recommends you allocate for the application and the amount of

Commentary/Jerry Borrell

memory you choose to devote to the application.

Let's say for example that I want to run *WriteNow* and *Pixel Paint*. I'll just keep on writing this column (saving first) and try the aforementioned procedure. Well, *Pixel Paint* needs an additional 1677 bytes; it won't open. So I'll adjust the memory used by *WriteNow*. That's odd, the suggested memory size doesn't appear in the Get Info box for *WriteNow*. I expect we'll see a lot of those discrepancies until developers catch up with the new System and Finder.

Maybe another application; how about *Excel*? I'll try a big file, say a 286K list. No luck; won't open. A blank *Excel* file does open. But I can't get at that list. Hmmm. I'll consult the Finder memory distribution box once again. Let's see: *Excel* 272K, *WriteNow* 224K, Finder 160K, System 430K.

As I sit pondering this, I have creeping memories of past experiences. Like the time I installed my first hard disk on an IBM PC. But this is the Macintosh. I didn't fall in love with this computer to have to partition my memory each time I open up a desktop full of applications. I don't want to understand fragmentation of memory that may prevent me from opening this or that application. The Mac should take care of this. I don't have time to play hacker/enthusiast with my Mac these days—I do too much work with it.

So the simple solution is to buy enough memory to avoid the issue. At least that appeared to be the answer until I discovered that even 2MB doesn't do it. And if I resolve this dilemma, I still have to worry about the potential for overheating the system board with all of that memory.

The Mac II is another story. The shortage of 1-megabit memory chips has postponed upgrades for the Mac II until recently. True, the cheaper 256K RAM chips are available, but they have a problem. It takes four times the chips to add an equivalent amount of memory, making it impossible to put the maximum 8MB on the Mac II system board. Also, until recently the Mac II had a 1MB limit per slot. The latter problem has been solved with a change in the Mac II's ROM, allowing developers to build cheaper memory cards for Mac II slots. It hardly seems a coincidence that Apple should lower its memory prices as this becomes possible. Whatever the marketing implications, at last we have memory coming for the Mac II.

Direct Drive Series

Affordable, reliable performance for *all* of us.

20 to 160 megabytes: a full spectrum of drives to meet every user's needs. The Direct Drive Series put all of us in business. Their excellent construction, high reliability and no cost "extras" have won them a wide following. Just look at what you get:

- Pre-formatted, they work right out of the box.
- Three way surge protection.
- The original external SCSI select switch plus a terminator access panel.
- 10"x10"x approximately 2" high, they fit neatly beneath the Macintosh.
- Free 2' SCSI cable. 6' cable available for small additional cost.
- Back-up software plus 9 MB of shareware and PD software.
- Full 1 year limited warranty.

We also include the quality support and service you expect from Jasmine.

JasPort: SCSI Power for the Macintosh 512

JasPort—our Macintosh Plus compatible SCSI port for the Macintosh 512 Enhanced or 512K with ROM upgrade—permits Macintosh users to take advantage of Jasmine's DirectDrives, MegaDrive, and other SCSI devices. User installable. **\$129** (Cash/ Visa/MasterCard)

Commentary/Jerry Borrell

Nor are these the only difficult situations facing administrators using Macs today. Take networks for example. Already we at *Macworld* are faced with the need to add a staff position to administer our network. At present Eileen Drapiza, our New Products Editor, takes care of this, but she's growing ever so tired of having to drop her work when the hue and cry goes up that "the network went down" or "the printer won't." Witness a recent five-day episode during which the LaserWriter appeared like a will-o'-the-wisp in our machines' Chooser boxes. The culprit was, of course, a nonterminated AppleTalk cable that runs to our art department. That discovery was of little solace to Eileen or to Senior Associate Editor David Ushijima, who lost valuable time playing network sleuths.

The solution is to add an individual to staff whose task it is to help upgrade System software and the latest drivers and keep the network working. But that's an expensive solution.

There is good news from the front. With Apple's release of MultiFinder, which will be sold at dealers for about \$50, we no longer have to worry about updating specific files in the System Folder. Now you insert the floppy disk, select Install, select the CPU that you intend to install the new software on, and select Install again. The installer replaces what it needs to. That's right—no more System-version hieroglyphics other than the single version number. You do have to boot the Mac from the new software disks, install, and then restart, but that seems a trivial inconvenience by comparison.

One light comment on the state of Mac affairs. You should write to Educomp (listed in the introduction to *Where to Buy*) for its library of start-up sounds for the Plus and SE—every cult classic imaginable. They automatically sound off whenever you start up the Mac.

Someone should build a library of dialog-box sounds. The next time I get one of those "Out of Memory" dialog boxes, I'd like to have something like the Klaxon from Epyx's *Sub Battle Simulator*: "Prepare to dive!" □

Desktop Communications for Macintosh

Palantir's inTalk® Version 3.0

inTalk continues to set the standard for state-of-the-art communications with micro, mini, and mainframe computers. The newest release of inTalk includes a variety of new, high-powered features for desktop communications:

- Support for Super Fast, Error Correcting Modems
- Complete Support for PBX Data Networks
- Yterm Binary Transfers for IBM Mainframes
- Clipboard Transfers for Remote, Interactive Work
- Support for All Macintosh Keyboards and Character Sets
- New CCL Script Commands for Automated Communication Sessions
- VIDTEX Emulation for CompuServe's Graphics
- Programmable Function Keys That Can Launch a CCL Script

For PC compatibles there's **Windows inTalk** with the same features and ease of operation. Both are perfect for corporate use, because there's no retraining when office personnel are shifted between computers.

Whether communicating with another Macintosh, a PC, or the corporate mainframe, no one does it better than Palantir!

Contributors Notes

Michael Alexander ("HELP!" and "Mac Charting Tools") is an Excel spreadsheet jockey who bought a Macintosh soon after covering the machine's debut for Newsweek. Ever since, he's helped friends, acquaintances, and even strangers on the street solve their hardware and software problems.

Danny Goodman (Business Clinic) has been writing about computers since the 1970s and has used the Mac since before its release. A Macworld contributing editor, he is the author of *Hands-on Excel* (Scott, Foresman & Co., 1986) and *The Complete HyperCard Handbook* (Bantam Books, 1987).

Bruce Maurier ("Insights on Adobe Illustrator") is an editor and illustrator with *Publishing Power*, a Palo Alto, California, desktop publishing firm. Since the day *Illustrator* shipped, he has been using it to produce commercial and technical art.

Jim Morton ("Shades of Gray") is a San Francisco printer and desktop publisher who produces *Pop Void*, a periodical about modern culture, using PageMaker.

Erfert Nielson ("The PostScript Difference") was a founding member of the Macworld staff. She put her art-school training to work and quickly became a Mac graphics specialist. Currently doing free-lance writing in Hollywood, she is probably the only writer in town not working on a screenplay.

Lon Poole (Quick Tips) has been educating Macintosh users since the machine was introduced. In his monthly column he answers questions and offers advice. A collection of these tips can be found in his book, *Mac Insights* (Microsoft Press, 1987).

Kevin Rardin ("Insights on Adobe Illustrator") is a desktop publishing and technical communications consultant. He's also the author of *Desktop Publishing on the Mac* (Plume/Waite, 1986), which won the 1986 Computer Press Award for the Best How-to Book. □

HFS compatible
including hard disks!

Solve Mac problems like an expert!

"1st Aid Kit" falls into that special category of 'must-have' products" (*MACazine*, April '87). It lets you handle every Mac problem from difficulties copying files, printing, and using AppleTalk networks, to recovering lost data from deleted or damaged files and unreadable disks.

Acclaimed by novice and expert alike, the 1st Aid Kit is much more than powerful software. At its core is a clearly written reference manual that:

- lists every imaginable error condition
- helps you quickly track down solutions to any problem
- takes you step-by-step through each recovery effort
- shows you how to avoid problems

"The definitive product for troubleshooting on the Macintosh" (*Macworld*, April '87). It "stand[s] head and shoulders above any other product like it . . . I can't recommend 1st Aid Kit strongly enough" (*MACazine*, April '87).

The Monitor That's Changing The Look Of Desktop Publishing.

Introducing the 19-inch Viking 1 for the Macintosh™ SE.

The critics have praised the Viking 1 as "magic" and "the clear winner"** for desktop publishing on the PC. Now this exciting new monitor is about to change the look of desktop publishing on the Macintosh.*

Here's why:

Introducing "Publishing Resolution.™"

The Viking 1's 19-inch screen allows for a full two-page layout. Its ultra-high 1280 x 960-pixel resolution provides a precise, tack-sharp image—unlike lower-resolution monitors that make it tough to read the fine print. Or higher-resolution monitors that create letters too tiny and fuzzy to read. And the Viking 1's unique square pixels assure that screen and laser-printer characters match perfectly.

Eliminates Flicker.

Some monitors have an annoying flicker that can frazzle your nerves. The Viking 1's exceptional non-interlaced 66 Hz refresh rate provides rock-solid stability.

Fast Screen Update.

With over a million pixels, screen updating can get sluggish on some monitors. The Viking 1 accelerates screen update by avoiding processor wait states.

Gets Your SE Involved.

With most large-screen monitors, your Macintosh is turned off—or just a repository for surplus windows and toolboxes. With the Viking 1, your Mac SE can serve as a 7x11-inch scrollable extension to the large-screen image. Or "roam and zoom" in the large-screen image, zooming in at two levels of "fat bits" magnification of whatever the cursor is pointing to.

IBM® Compatibility.

The Viking 1 is the only monitor that's compatible with both the Macintosh SE and the entire IBM line of PC/XT/AT and PS/2 computers. So you can stay flexible and grow.

Viking 1 For The Macintosh

Beautiful!

Over a million pixels...
perfectly positioned across a paper white screen. Two entire pages of publishing magic in optimum "Publisher's Resolution."

Beautiful, isn't she...
The Viking 1 for the Macintosh? ...called everything from "magic" to the "clear winner" in desktop publishing.

Over nine years of monitor design...
from the leading monitor supplier to the high resolution marketplace.

*The Moniterm Viking 1.
For publishing
that's big, bold and beautiful.*

MONITERM

Spend A Minute With Moniterm.

That's all it takes to *really* visualize the benefits of the Viking 1. For a screening, contact the dealer in your area, or return this card for more information.

Icon Review's Prices Are Made to Order

Enlarge Your Mac's Screen 526%

MegaScreen II

From MegaGraphics

MegaScreen opens up a whole new world for desktop publishing, CAD, spreadsheet preparation, graphics, and project planning. Its 19.5" monitor preserves the Mac screen's 75 dpi pixel density, but is five times larger! Spreadsheet users will be able to see a whole year's worth of data at once, and desktop publishers can work on two-page spreads without scrolling.

The MegaScreen is designed for easy clip-on installation with no soldering required. And unlike the software that comes with many large-screen monitors, MegaScreen's comes packed with special features that let you do more than just double-click an icon to boot the screen. The utility software gives you precise control over resolution and refresh rate, and MegaZoom, a program that causes the Mac screen to function normally while the MegaScreen displays the same smooth image, four times larger — ideal for demonstration/display or as an aid for the visually impaired.

Why put up with small-screen tunnel vision? Order MegaScreen today.

VideoWorks II

From MacroMind, Inc.

How can you move your audience if your Mac images just sit there? VideoWorks II makes it easier than ever to add the sound and motion that create dynamic business presentations, animated educational courseware, and effective point-of-sale displays.

New version makes it simple to combine images from virtually any program into a slide show; add fancy transitions (dissolve, fade, wipe, etc.), insert animated clip art, include movies, overlay text on slides or movies, and incorporate sound. VideoWorks II performs in vivid color on the Mac II and even comes with its own library of ready-to-use movies, sounds, artwork, and animated clip art.

2181 • Works w/Mac 512K, Mac Plus, SE & II

\$125

Fanny Mac

From Beck-Tech

Avoid system burnout with Fanny Mac. This dependable fan reduces your Mac's operating temperature as much as 50° and has a built-in surge suppressor to keep your data safe from destructive power surges.

Efficient and convenient, Fanny Mac moves air through your Mac at 24 cubic feet/minute and comes with a "pass-through" power assembly that lets you use one power socket for both Mac and fan.

And it's built to last — ball-bearing construction keeps Fanny Mac on the job twice as long as sleeve-bearing fans. Lightweight and compact, all this protection fits neatly into the handle of your Mac and pops out quickly for easy transport. Prolong the life of your Mac with Fanny Mac.

Works w/128K, 512K, Mac Plus & SE

Tempo 1.2

From Affinity Microsystems

Use Tempo to automate time-consuming operations in almost any application. Simply record your activities (such as entering text or clicking on menu commands), then replay the sequence as one command. Insert boilerplate text, format programs with simple Command-key strokes. We use Tempo with PageMaker to automate routine type formatting. By assigning keystrokes to sequences of point size, leading, and tabs, we avoid thousands of tedious manual commands.

New Tempo 1.2 lets you assign additional macros to the function keys on most extended keyboards.

Good anywhere in U.S.

Monday thru Friday 6 am to 7 pm
Saturdays 8 am to 4 pm (Pacific Time)

408/625-0465

POLICIES: We accept MasterCard and VISA with no added service charge. Your credit card is charged for the full amount of your order when your order enters our system so that we can reserve your products at the prices quoted. Personal and company checks accepted; for faster delivery, send certified check, cashier's check, or money order. Sorry, we can't accept COD's.

- We accept corporate and school Purchase Orders (for a minimum of \$250 for initial orders, \$100 for subsequent orders) upon approval of credit.
- California residents, please add 6% sales tax to your order.

GUARANTEE: All products shipped by Icon Review are new and guaranteed by the manufacturer to work. All defective merchandise will be repaired or replaced by the manufacturer. Icon Review cannot guarantee machine or color compatibility. Please select your merchandise carefully.

TECHNICAL SUPPORT: Need more information? Icon Review maintains a technical support team for your convenience. Call (408) 625-0465 if you need help — before or after ordering.

CHANGES & CANCELLATIONS: You may change or cancel your order at any time prior to shipment. Subject to availability, orders are usually shipped within 48 hours; priority orders are shipped the same day if received before 2 pm PST.

RETURNS: All returns require a Returned Merchandise Authorization (RMA). Phone 800/228-8910 to receive your RMA. All returns must be complete, including all original warranties, manuals, documentation, and packaging. Please include a copy of your invoice or packing slip and a description of the problem. Due to software copyright laws, all sales are final. No returns authorized after 30 days from date of shipment, and no returns accepted without an RMA.

SHIPPING & HANDLING: A shipping and handling charge will be added to your order.

Domestic Service - 48 States & Canada

We will ship your products by UPS or US Mail Surface unless you specify otherwise; Second-Day Air Service to Hawaii, Puerto Rico, Alaska; Priority Next-Day Air Service, be sure to have our salesperson check stock. Priority backorders are shipped Second-Day Air.

International Service

We serve most European locations (served by UPS) — including U.K., Scandinavia, France, Italy, Germany & Japan — \$40.00 minimum shipping & handling charge or 21% of the total purchase price, whichever is greater. We also serve Africa, Australia, Spain, Portugal, Mexico, South America, Philippines, etc. — write or phone for rates.

All prices, specifications, and availability subject to change without notice.

By hand:
26 hours, 37 minutes.
And counting.

With Adobe Illustrator:
12 hours, 42 minutes.
Finished.

The art of Adobe Illustrator.

This side-by-side comparison demonstrates the power, productivity and art of Adobe Illustrator.™

On both sides, the artist started with a rough sketch which he traced over. (Adobe Illustrator allows you to trace over other kinds of existing art, as well.)

After that, all similarities end.

The Adobe Illustrator side is not only finished, it's cleaner, sharper,

and includes details—like the strobe effect

on the minute hand and maddeningly precise little circles on the rim—that

simply can't be duplicated by hand.

To get these effects with Adobe Illustrator, you simply draw, step, and repeat the desired shape in whatever position or angle or size you like.

For example, the artist drew a single gear, then resized it and put it in different places. And Adobe Illustrator held the desired line weight regardless of image size.

You can also rotate, add type, combine one image with another, share images with other users, or even incorporate images into the most popular page layout programs.

Finally, with Adobe Illustrator, you can edit your drawing and get new art in minutes. Which beats opaquing any day.

Just pull down a menu and tell your Macintosh Plus, SE, or II to "print." And get camera-ready art out of any POSTSCRIPT®-equipped printer from a 300-dpi laser printer to a 2540-dpi typesetter.

Call us at (800) 29-ADOBE, or (415) 962-2100 from Alaska or Canada.

So you can find out where to see and buy the Adobe Illustrator before any more time goes by.

Adobe
Illustrator

Now a work of art doesn't
have to be a lot of work.

Adobe Illustrator is a trademark and POSTSCRIPT is a registered trademark of Adobe Systems Incorporated. Other brand or product names are trademarks or registered trademarks of their respective holders. © 1987 Adobe Systems Incorporated, 1585 Charleston Rd., Mountain View, CA 94039-7900.

ADOBE
SYSTEMS INCORPORATED

You'll notice the side done by hand is unfinished and not nearly as crisp as the Adobe Illustrator side. That wasn't done on purpose. Both sides were done by the same talented artist, Jeffery West of Jeffery West Design, who, until recently taking up Adobe Illustrator, made his living with pen-and-ink.

Circle 678 on reader service card

Totem II.

A little drive goes a long way.

In this era of tight desk real estate and massive storage requirements, our new Totem II disk drive can do a lot to make your life (or business) a whole lot simpler.

Like our other Totem drives, Totem II uses removable cartridges that offer super high capacity — a whopping 20 megabytes.

Which is roughly 25 times the storage you can expect from a standard floppy. And at least 5,000 more pages than you can store on comparable removable media.

Not bad for a little guy that stands a mere three inches tall.

And, you'll be pleased to notice that Totem II is priced for budget-conscious Apple users. At such a low cost per megabyte, you won't have to feel guilty about storing all those space-grabbing projects.

You can organize all your desktop publishing, accounting, music, graphics, writing or business files with far greater ease and in much less time.

Because at 37 ms, our Totem cartridges let you access files much faster than any other high-capacity floppies.

Furthermore, Totem cartridges incorporate the same durable, Bernoulli technology that for the past two years has already proven itself to our Hewlett-Packard computer users throughout the world.

You won't have to worry about *securing* your files, either. Our totable, 5¼" cartridges can be locked in a safe or drawer, so sensitive information won't fall into the wrong hands.

	Totem II
Cartridge capacity	20MB (10,000 pages)
Media type	Durable, long-lasting Bernoulli cartridges resist bead crashes
Access time	37ms
Warranty	One year
Price	\$1,195

So if you're looking for extremely high reliability, you can rest assured your data is secure and won't get corrupted.

Circle 627 on reader service card

If you're looking for portability, you can tote our little 8-lb. Totem II drive in your briefcase or MAC bag. And speaking of MAC, Totem II fits neatly right under your MAC, MAC Plus or SE. It's MAC II-compatible, as well.

Each Totem cartridge holds 20MB of data.

For more information or for a copy of our latest brochure, call us now at 800 BERING 1 or 408 379-6900. Bering Industries, 240 Hacienda Avenue, Campbell, CA 95008.

Tales of the MultiFinder

Behind the new system software is a controversy that cuts to Apple's core

MultiFinder made its debut at last summer's Macworld Expo, an event that will ultimately be remembered as the high-water mark of the Macintosh. The crowds were reminiscent of the 1982 Comdex, when people suddenly realized that microcomputers were not only real, but growing explosively, and those who got in then would reap big bucks. In 1987 the Bayside Convention Center was teeming with people in business suits who smelled money in the Mac.

The most talked-about product was *HyperCard*, which I'll discuss in another column. The most *important* product was MultiFinder. This program, a sort of super-Finder, provides the illusion (and, in many cases, the advantages) of running more than one program at a time; and it embodies the past, present, and future of the Macintosh. It has enabled Apple to smugly proclaim superiority over the IBM world, which can only promise a similar product sometime in the future. By that time, Apple executives hinted, an enhanced version of MultiFinder would preserve Macintosh's technological head start.

But the MultiFinder story, like the Apple Computer story itself, is bittersweet. Its resonances, its strengths and shortcomings, are, almost as if genetically determined, inextricably linked to the controversial Apple character. One could easily detect this heavy baggage when the product was introduced by Apple's technology czar, Jean Louis Gassée. The French-born executive felt compelled to insist that none of the programming code used in the MultiFinder was held in common with code written by a former Apple engineer for a similar program that had somehow gained notoriety. It was an odd remark, a seemingly gratuitous insult. But as we shall see, it cut to the truth of the matter.

Split Apple

That unnamed programmer was, of course, Andy Hertzfeld, a name familiar to most *Macworld* readers as one of the prime software wizards of the original Macintosh. Hertzfeld, a resolutely upbeat fellow now in his early thirties, sees his years working on the Macintosh as the major event in his life thus far, and he takes inordinate pleasure in seeing people make the most of the computer he helped to create. Andy Hertzfeld doesn't work at Apple anymore, but his Macintosh love affair has lingered; in the past few years he has devoted his talents to writing products that will enhance the Mac and help it in the marketplace.

While his goals would seem to match Apple Computer's, the company's relations with Hertzfeld have been ambivalent. Some personal clashes might have contributed to this, but the heart of the matter is that Andy represents the Old Apple of the hackers—flaky, scruffy, passionate, and irreverent. The New Apple sees itself as en-

ergetically committed, but also professional, reliable, well-dressed, and in tune with the needs of conglomerates and robber barons. The New Apple likes the luster of its rambunctious youth, but wants the world to know that it has grown up.

The other problem with Andy is that he is associated with the reign of Steve Jobs. The former chairman and cofounder is still Apple's unwelcome Ghost In The Machine, and no amount of success seems

(continues)

Now that there's an IRMA put your old ideas about m

PC Coordinators have been debating the viability of Macintosh[™]-to-mainframe links for a couple of years now. With opinions varying from impeccable to impossible.

But no matter what ideas you might have on the subject, they are now old ideas.

Because DCA has introduced MacIRMA[™]. And all the reliability and ease of use that

made IRMA[™] the PC-to-mainframe industry standard has come to the Macintosh II[™] and Macintosh SE[™].

How does that help you? Well, MacIRMA can support the DCA and IBM[®] mainframe file transfer software that you probably already have installed in TSO, CMS and CICS environments. Allowing you to actually offer

for the Macintosh, you can mainframe links in their place.

your users a choice of either Macintosh or IBM microcomputers while maintaining consistent 3270 connectivity.

And you can offer the same training and support to each of them regardless of which microcomputer they choose.

What's more, MacIRMA's 3270 emulation software is a true Macintosh application.

It works with a "mouse," pull-down menus, is compatible with Switcher™ and Multifinder™ programs, and supports "copy-and-paste" to incorporate mainframe data into word processing or spreadsheets.

And that's just for starters. For the whole story, call DCA, toll-free, at 1-800-241-IRMA, ext. 535.

to be able to assuage the corporate Oedipal trauma.

A Switch in Time

What happened with MultiFinder illustrates the paradox. The program was really born from the limitations of the Finder, the file-handling program in the form of a desktop that was released with the original Mac. On early Macintoshes, closing down one program and opening another was a process that one did not undertake without setting aside some spare time. Competing computers did not have this problem, and it was something that, in certain eyes, damned the Macintosh to the status of a toy or curiosity. But no one really addressed that problem until Andy Hertzfeld, on a suggestion from writer John Markoff, hacked up a program called *Switcher*.

Switcher was originally a two-week project, done in time for the first Hacker's Conference in November 1984. Apple immediately saw the program's value, and Steve Jobs himself bought the program from Andy for \$100,000 only minutes after viewing it. For Apple it was money well spent, as *Switcher*, in its various versions, became a terrifically useful, if not particularly robust, program.

By the next summer the Mac market was floundering. As Andy Hertzfeld roamed the sparsely attended aisles of the August 1985 Macworld Expo, he wondered what else he could do to help the Mac. He decided to rewrite the Finder, incorporating the features of *Switcher*, so the computer would be even easier to use and could more easily run several programs at once. So he set about writing a program to be called *Servant*. By the New Year he had it running. Indeed, it had multiple windows: you could open a program and then, by downscaling a window, see the desktop. From there, you could open another program, and another. Andy began to see how you could even do some multitasking—actually using one program (say a word processor) while a second program was performing a task (such as a communications program downloading a file).

Hertzfeld took *Servant* to Apple and showed it to the systems software group. There were gasps and buggy eyes—the previous day the group had set as its top 1986 priority to do a similar program. In no time Andy was negotiating to sell his work to Apple. The price this time was to be around \$200,000. But Andy Hertzfeld was troubled. He had no confidence that the

Laser Super Spool™

The fastest
LaserWriter®
print
spooler
under
the sun.

BLINDINGLY FAST. By sending your print files to the background and returning control of your Mac to you, SuperLaserSpool lets you work and print at the same time. And it does this 5 to 40 times faster than its nearest competitor.

SuperLaserSpool gets you back to work fast. You never wait for the printer, no matter how many documents you have queued up or even if the network is busy. SuperLaserSpool automatically manages the entire printing process while you work.

WORKS WITH ANY APPLE® PRINTER. SuperLaserSpool can print to the LaserWriter and ImageWriter™ (either direct-connect or AppleTalk™ connected).

INCREDIBLY COMPACT. Other spoolers require so much storage space that a hard disk is essential. Not so with SuperLaserSpool. You can use it with floppy-disk systems because its files are so compact.

Look how much faster SuperLaserSpool will give your Mac back compared to its competition.

SuperLaserSpool's files are so small, you don't have to worry about running out of disk space.

spool files are always safe, even if the system crashes.

SuperLaserSpool works with almost all Macintosh applications. You can even leave and enter different programs without disrupting the printing of documents.

And it's completely invisible: You can launch it and forget it's even there.

- SINGLE-USER: \$149.95
- MULTI-USER: \$395.00

Get SuperLaserSpool at your local SuperMac dealer today, or order direct.

CANVAS™

Introducing Canvas™. The only graphics program that integrates MacDraw™ type objects, high resolution 300 to 2540 dpi images, PostScript™ and MacPaint™ type graphics in a single document.

No more switching from one window to another. No more cutting and pasting between different programs. Everything you want in one program, in one document.

Use Canvas™ for corporate slide presentations, forms, complex graphics, diagrams, newsletters. Any where you want stunning results.

Import graphics from other programs like 4th Dimension™, Excel™ and More™ to customize charts and graphs.

We've even included a desk accessory version so you can use Canvas™ from within your word processor, spreadsheet, database or desktop publishing program.

Canvas™ allows you to view and edit in any magnification or reduction from 3.125% to 3,200% for incredibly precise control of your image.

Canvas™ is packed with features and powerful special effects. Bezier curves. "What you see is what you get" (WYSIWYG) text editing. 9 feet by 9 feet of *continuous* drawing area. MacObjects™ (graphic macros). TIFF support. And much more.

So if you're looking for the best of everything, look into Canvas™.

Visit your local dealer for a complete demonstration of Canvas™ and other Deneba software including: Coach™, the best selling interactive spelling checker desk accessory, Comment™, the original Macintosh equivalent of 3M's Post-It™ notes and the Coach™ Merriam Webster Thesaurus.

TRACK PROJECTS. CAPTURE CASH. NO SWEAT.

If you bill for your services by the hour, you need TIMESLIPS® III

Without a good time and billing system, your business isn't collecting all the money it's earned. You have to manage the billing process by tracking your expenses and accounts receivables. You need to know who is being billed and why.

Automatically Tracks Time And Expenses. TIMESLIPS® III gives you faster, more accurate billing, recovering cash that could have fallen through the cracks.

It's A Desk Accessory. TIMESLIPS III runs concurrently with other programs, and can be called up whenever you need it.

A built-in "stopwatch" times any phone call or activity as you work. Then automatically calculates the total fee and updates your client file. Instantly.

A unique "dollar clock" can appear in the corner of your screen to keep a running tab of time and billable dollars.

Understands Your Needs. Unlike other billing systems, TIMESLIPS III allows for *real-time* entry of expenses information while within another program.

Like time and billing systems costing lots more, it provides expanded description on each timeslip. It exports data to virtually any program that accepts tab-delimited files, such as Excel,™ Jazz,™ and Microsoft Works.™

© 1987, North Edge Software Corp. All Rights Reserved.

Generates Custom Bills And Reports.

With over 5,000 ways to create a bill, you can satisfy any client demand, or meet any office need.

TIMESLIPS III generates transaction reports, client history, aged receivables, and management reports.

Tables, bar graphs, pie-charts, easy-on-the-eye formats leap to the screen, giving you masterful control and analysis capabilities. Information, intelligently organized so you don't have to be.

TIMESLIPS III Is A Productivity Tool.

It gives you a clear picture of your business: an activity-by-activity breakdown for each project. What was accomplished. How long it took. And the actual fee.

You Probably Can't Outgrow

TIMESLIPS III. It lets 250 of your colleagues handle 2,000 clients, with up to 128 projects per client. And track all simultaneously.

30-Day Money-Back Guarantee.

If you're not happy, we'll return your money.* In the meantime, you'll find our level of technical support virtually unparalleled.

Send for TIMESLIPS III. It's one of the most powerful, yet easy to use time and billing systems ever offered. Compare it to any other, at any price.

*Performance Without
Compromise.*

Mac II power for the SE:

Once you try an accelerated SE, you won't want to go back. Prodigy SE™ by Levco gives you the highest performance, true Mac™ II and SE compatibility, and *confidence* that your system will expand properly. Here's how:

High performance design— no compromise.

The Prodigy SE gives you the 32-bit 68020 running at 16MHz, with fast, 32-bit memory. Like the Mac II. Not the slower, 16-bit memory on the SE motherboard that some accelerators use.

The 68881 coprocessor chip that speeds math operations up to 100 times now comes *standard*.

Your SE will run Mac II software faster than a Mac II. Unlike some other accelerators, Prodigy SE lets you switch back to *native* SE mode.

The Prodigy SE can expand to 32 Mb of RAM. (Some accelerators limit

you to 4 Mb.) And, like the Mac II, Prodigy SE includes a socket for the PMMU chip that is essential for Apple's® upcoming A/UX™. Boards without the PMMU lock you out of Apple's next-generation software.

Keep your SE expansion options—no compromise.

The Prodigy SE's optional SE expansion slot lets you connect *your choice* of SE expansion peripherals. Like our SuperView large screen monitor.

Some accelerators don't give you a true SE expansion slot, limiting your options.

Superb support— no compromise.

Our thorough documentation—rated highest by InfoWorld—will answer your questions. Our high performance support hotline will solve your problems. Period.

For your nearest *authorized* SuperMac™ dealer, call today.

Find out why Byte Magazine, when comparing SE accelerators, concluded, "The Prodigy SE wins on both performance and peripheral expandability." Or why InfoWorld has given Prodigy SE the highest rating of all accelerators reviewed.

new Apple would preserve all the neat tricks and user-pleasing ideas of *Servant* in its own finished product. The strength of *Servant* was in its more powerful interface—new ways to show icons, move them around, and arrange them on screen—but Apple wanted to emphasize multitasking in its eventual product. Hertzfeld couldn't sleep at night, torn between preserving the artistic integrity of the product and doing "what would be best for Mac."

He thought he could do a better job of writing the program himself, insulated from the Apple bureaucracy. But he knew that no matter how good his program was, it didn't have a chance at effective multitasking unless Apple itself marketed the program as basic system software. Only then, with the mother company supporting the product, would there be incentive for those who write applications software to conform to the inevitable restrictions of this new Finder so that the applications would "behave" together.

Finally Hertzfeld arrived at a solution. He approached Apple and offered them the program for *half* the \$200,000—if they would take nonexclusive rights. That way, he would work on his product, and they would work on theirs. Apple accepted, and MultiFinder was underway.

Andy, meanwhile, continued to work on *Servant*, which he intended to distribute free to anyone who cared to have it. The dream would be preserved.

Every Twitch Way

That's Andy's half of the story. Now for Apple's.

By 1986 it was clear to everyone at Apple that the Mac needed a new Finder that could handle more than one program at once. That capability was expected on the new Mac II, and it would be a boon to Apple if the program would work on older Macs as well. Why Apple was not hard at work on this *before* 1986 is a mystery, and maybe a scandal, but in any case it became a priority. The person charged with creating this software was Erich Ringewald, then 26, an Apple engineer since March 1985. It was Ringewald who had been assigned responsibility for *Switcher* support in the latter versions of that program, though his relationship with Andy Hertzfeld had never been warm. Ringewald respected Hertzfeld's talents, but thought he could do the new Finder, code-named Twitcher (clever, huh?), very well, thank you, without Andy's help.

The precision of a DRAW program

The fine detail of a PAINT program

Now combined in

SuperPaint

Graphics for the Macintosh will never be the same again. Before it was paint or draw. One or the other. Now, nothing less than both will do. With SuperPaint, you can edit dot by dot in the PAINT layer and you can create and manipulate objects in the DRAW layer.

Until recently, paint programs only printed at 72 dpi. Now SuperPaint's unique LaserBits™

feature allows you to magnify and work on dots in the paint layer at an amazing 300 dpi resolution! These high resolution images can be pasted directly into your word processor or page layout program.

SuperPaint. When all you need is a masterpiece!

(compared to other paint programs) "SuperPaint is the clear winner and... MacPaint's heir apparent."

Adrian Mello, *MacWorld*, Jan '87

"SuperPaint is the hottest graphics package currently available."

Bob LeVitus, *MACazine*, Jan '87

"Is SuperPaint really super? Absolutely."

According to Ringwald, Apple's purchase of *Servant* was irrelevant to those working on Twitcher. "We had the same goal, but Andy was beginning from the old Finder and interested in user extensions to it," he says. "I was interested in a stable mechanism [to run more than one program at once]." A big difference between the two programs is how they handle windows when two or more programs run at once. (Just how they differ is too technical get into here, and I suspect it's one of those religious battles that programmers have.) As far as Ringwald was concerned, Apple's purchase was unnecessary, and he insists that he was never even curious to see *Servant*.

Ringwald was later joined by a new Apple programmer, Phil Goldman, and by the end of 1986 Apple was ready to send a prerelease Twitcher to selected developers, under the name of Juggler. The biggest problem, as expected, was accommodating applications that "misbehaved" in certain ways: some programs try to hog the whole machine. Ringwald thinks he did a pretty good job in dealing with those malefactors, or at least setting up rules for their rehabilitation in future versions. By the time of the Expo, when the program was announced, MultiFinder (alas, the nifty Juggler name was already taken) was able to run an impressive demo without crashing. Judging from the educated oohs and ahhs from that demo, Apple did the right thing with MultiFinder. By concentrating on the juggling power rather than *Servant*-like user-interface features, it gave its customers what they needed immediately.

How soon they would have done this without Andy Hertzfeld's original contribution is a matter of opinion. My opinion: not soon enough.

Memory Lane

So where are we now? Well, MultiFinder is a big step for Apple, which sees it mainly as that—a step. Charles Oppenheimer, Apple's mouthpiece for MultiFinder, explains that system software is "not a point in time, it's a continuum." At this point in the continuum, we have a Finder heir that can kind of do multitasking. That near-hit does not satisfy everybody. In these grown-up days of Macintosh, there is no shortage of techno-weenies and MIS guys who huff and puff and say, "Can this do *true* multitasking?" And to those, Charlie Oppenheimer says, "Not exactly." But he says MultiFinder will increase the

Servant uses the hand to move around, instead of scroll bars. The tools at the bottom of the window let you navigate in the window and customize the user interface. Here, a magnified view is selected and the file-size icon (ruler symbol) is selected, causing the file's K count to appear under each file or folder name.

utility of the Macintosh because it is now absurdly easy to have several applications open at the same time. This is especially helpful for those running *HyperCard*, a program that works best if it is "on" all the time. And what multitasking MultiFinder does do—background printing for laser printers and communications while other programs run—is the kind of thing most people will use. Best of all, MultiFinder does this on Mac Pluses and SEs as well as the Mac II, something we veterans will appreciate.

Later on will come a version in which programs not only run at the same time, but also run *with* each other. How much later on is anyone's guess.

It's a brave new world, but there is an entry fee. MultiFinder takes up a lot of memory on its own—so much that with "only" a megabyte of memory, the hopper fills up after only one decent-size application, negating the purpose of the program. And *HyperCard*, presumably the program that will take most advantage of MultiFinder, won't run *at all* with MultiFinder in a 1Mb machine. Since at this writing no Apple computer comes standard with more than 1Mb of memory, we are now in a situation analogous to the days of the 128K Mac, the last time Apple shipped a computer with insufficient power to run its standard software. Now 2Mb is the obvious minimum, probably 3Mb if you want *HyperCard* on all the time.

People will eventually get the extra memory, and the New Apple will find MultiFinder a valuable weapon in its battle for real-world acceptance for the Macintosh. The present MultiFinder is a big win, and its future looks even more promising.

For Andy Hertzfeld, though, the experience has been mixed. He's spent months working on his version of the Finder, *Servant*, perhaps imprudently. "I couldn't help it," he says, "I wasn't working on it, it was working on me." *Servant* is now available on CompuServe and other bulletin boards, and from user groups. You should check it out, see the way it handles icons, and marvel at its file-copying tricks. Have fun with it. Andy hopes that its innovations will find their way into Apple's system software: "In a way, I'm forcing Apple to improve things. If I come up with a better way of doing something and people see it, Apple will copy it." Or so he hopes.

Meanwhile, MultiFinder is here, relegating *Servant* to the status of a curiosity. MultiFinder is not so much fun as it is productive. Just like the New Apple. The Macintosh, as evidenced by the gold-diggers at the Expo, has finally made it. Nodding toward the masses of well-heeled professionals making the rounds of over 200 exhibitors at the show, Andy Hertzfeld admitted that it was the end of an era. "The Mac roller coaster has come to a halt," he said, indicating that the days of ups and downs have been replaced by stable acceptance. "It's time for me to get off and find a new one."

For Apple it's time to consolidate and improve, and to make further inroads into the serious world of computing. The MultiFinder and its descendants will do that. But I hope the company won't forget the early creativity that gave Mac its technological head start—nor the people who, with the foolishness of lovers, gave years of their lives, as well as their hearts, to a computer and a dream. Apple will survive without Andy Hertzfeld and indeed without Steve Jobs. But there is no need for Apple to purge its zealous past in order to preserve its productive future. □

How to expand 20Mb of external storage to 120Mb

The Competition

Only MASS MICRO Systems offers you the **POWER2 EXPAND!** for \$445

MASS MICRO Systems drives are designed with YOU and your Mac in mind! Our exclusive design allows you to start with 20Mb to 100Mb and expand your system up to 200Mb anytime you need the **POWER2 EXPAND!**

No Expensive SCSI terminator required!

2 surge-protected switched outlets means one switch turns on your entire system

Precision push-button SCSI ID switches. No tools needed!

Lightning fast average access of less than 35ms, low power consumption, and a unique locking system to automatically store the heads on power down, give our drives real value. More than reliable, with a 25,000 hr MTBF (one of the highest in the industry) you can depend on them for a long, long time!

Ergonomic design gives you the optimum viewing angle

Order Today - get the **POWER2 EXPAND!** into your future! Includes our 24 hr/day, 7 day/wk Support Hotline, 30 day money back guarantee, and a 1 year warranty. Buy direct and save!

Rags to Riches 3 Pak GL/AR/AP Version III by Chang Laboratories

Rags to Riches Version III provides users more "Choices" in their accounting selection, setup, operation and reporting! Each module has more options to let you customize the operation to the way YOU do business. It gives you more flexibility to format reports, invoices and statements to suit your personality. This is the fastest accounting package available for the Macintosh. Success in accounting can be yours with **Rags to Riches Version III**.

Rags to Riches 3 Pak (GL/AR/AP) Version III 279.

Word Finder by Microlytics, Inc.

Word Finder is an electronic thesaurus in desk accessory format. Once you select **Word Finder** from the Apple menu, it appears in the menu bar of the program you're using. Just select the word you want an alternate for, and up pops a window of synonyms. Simply choose a synonym, double click on it, and the new word replaces the old word! Add that extra "pizzaz" to your writing with **Word Finder**.

Icon-It!, DA-Switcher, and Post-ART by Olduvai Software

With *Icon-It!* you can add life to all your applications by assigning familiar pictures to represent menu items or desk accessories. A simple click will do the job — and you can even launch Excel or Tempo macros with icon selections. *DA-Switcher* is designed to allow you to use an unlimited amount of desk accessories by letting you "switch" the accessories in the Apple menu. And, *Post-ART* is a 3-disk set of full-size illustrations by the award-winning artist J. Ciccone which includes software that allows you to print every

Post-ART file without the need of a drawing program!

Icon-It!	40.
DA-Switcher	25.
Post-ART	35.

SmartScrap & The Clipper by Solutions International

SmartScrap & The Clipper includes two desk accessories that enhance the way you deal with your clip art. *SmartScrap* is an improved scrapbook DA that allows you to see all your clip art by scrolling and lets you keep multiple scrapbooks on any disk. And, *The Clipper* is a great cropping and scaling tool that determines the dimensions of an area where a picture is to be pasted, reducing or enlarging it to the exact dimensions needed.

SmartScrap & The Clipper	38.

DaynaFile. The Search For IBM PC File Compatibility Is Over.

Tired of hacking through the jungles of MS-DOS in search of data file compatibility for your Macintosh™? Or fighting a tangle of networks, cables, and add-on cards, just to edit a simple file?

Discover DaynaFile,™ the simple, practical solution to IBM PC file compatibility.

DaynaFile is an external disk drive that lets your Macintosh read from and write to a DOS-formatted data disk.

A SCSI port connects it to the entire family of Macintosh computers from the Macintosh Plus to the SE and Macintosh II, without an add-on card.

Imagine what that means. With a simple disk drive, you can now access thousands of IBM data files created by programs such as Lotus 1-2-3,™ dBase III,™ WordPerfect™ and AutoCAD™—with the ease of Macintosh. Just point and click.

And, as a single or dual-drive unit, DaynaFile can handle all the IBM personal computer file formats you have to deal with, in both 5¼" and 3½" disks.

That's the compatibility you've been hunting for.

So call us today. And call off the search.

*An interview with Heidi Roizen,
president of T/Maker*

Heidi Roizen is the president of T/Maker, a Mountain View, California, publisher of software for both the Macintosh and the IBM PC. She began her career with computers as the editor of Tandem Computer's company newsletter while a graduate student at the Stanford School of Business. After completing her MBA, she became the head of T/Maker, a start-up founded by her brother to publish a visual spreadsheet program (a table maker—hence the company name). For the past five years Roizen has directed T/Maker's release of products for word processing, desktop publishing, clip art, graphics, fonts, and spreadsheets.

Currently T/Maker publishes 13 products for the Mac, including a dozen titles in the Click Art series of fonts and clip art. Last year the company negotiated a major coup: acquiring the right to market WriteNow for Macintosh, the word processor Steve Jobs anointed as MacWrite's successor. Sure enough, WriteNow has usurped the number-two word processor spot from Apple's now-aging original.

Your company no longer markets the program that was its namesake, so what does T/Maker do today?

We are the conduit between talented developers and the consumers. Those two communities don't talk to one another, don't understand each other's terms. Our staff epitomizes power users, so we see good products from a user's perspective. Our job is to put the resources behind the developer's ideas to see that they happen.

We catch a product before all of its features are defined, when the kernel is there. We feel our input about features and the user interface is critical to the success of the product. Developers joke that they walk into T/Maker with a product 80 percent finished and leave with a contract and a 20 percent finished product.

Most companies in the software publishing market have a Betty Crocker plan for the business: get investment money, develop a product, promote awareness of the product, buy market share, and get acquired or go public. Then retire to Portola Valley. In other words, most companies in this market think in terms of fast revenue growth, not profits.

We're different. Our goal has always been to be in business for the long haul. Our goal is profitability, and we seek opportunities for profitable growth. Yet in spite of our relative inattention to the top line—gross revenue—we've twice been on the *Inc.* list of the 500 privately held companies with the fastest growing revenues. I guess that means our strategy works.

The entire Mac software industry is now in the process of restructuring—witness

the series of small companies that have merged with larger, more established corporations. How do you plan to direct T/Maker?

We have lots of strategic relationships with other companies: NeXT, Borland, Software Publishing Corporation. We also have a lot of name recognition in the market—for the company name, for *Click Art*, and for *WriteNow*. We've been in the market four years with Mac products. To establish that market awareness now would cost a great deal of money.

There are other developers today creating competitive products, but we can still sell more because of the distribution channels. Distributors know that we exist, that we stand behind our products and will be here tomorrow. That takes time to achieve. So we'll continue to use our name, expertise, and organization to bring new Mac products to market.

Like what?

We're still concentrating on *WriteNow*, maintaining it as a standard product for the Mac. There are promising areas of desktop publishing—for example, fonts and accessories—particularly products that are resolution-independent. In other words, desktop publishing products that can work across all personal computer systems. We'll continue to publish innovative products.

What exciting product areas do you see in the market?

First, the area that takes advantage of increased printing resolution—the adoption of the Encapsulated PostScript Format (EPSF) standard and beyond. Second, the new approach to integrated software. In

To the thousands of Macintosh™ users who find themselves wishing there was a personal printer that lived up to their personal computer.

Including the executives, entrepreneurs, academics and other professionals looking for an affordable entree into the world of desktop publishing.

General Computer presents the reassuring paradox you see illustrated on these pages: the first affordable laser printer that prints like it costs thousands more.

INTRODUCING THE PERSONAL LASERPRINTER.

As the documents shown here demonstrate, the General Computer Personal LaserPrinter™ (PLP™) concedes nothing in printing capability to systems selling for twice its price.

If that still seems hard to believe, consider this. Until now, anyone who bought a laser printer was also buying a computer. Because laser printers have always needed a processor, memory and other expensive hardware to create a printable page.

Our laser printer, on the other hand, eliminates a great deal of this expensive hardware in favor of ingenious software.

Software that allows the printer's imaging to be performed by the

THE PRUDENT Investor

Time to Return to Gold?

There's probably no better hedge against inflation. Gold is the internationally recognized medium of exchange. It's completely portable. And, unlike paper money, it has inherent value. But is it for you?

In times of economic or political turmoil people turn again and again to gold.

That's what makes gold prices go up in times of inflation. And why gold moves up when world peace is threatened.

As an investor, you have five basic ways to purchase gold.

1. Gold futures, like all futures contracts, are basically closed-ended speculations intended for sophisticated traders.

2. Gold stocks. Shares in mines are traded on all major exchanges. Some, especially South African mine shares, pay substantial dividends. (This is due to the volatile political situation there.)

3. Gold bullion can be bought at all large brokerage houses. These firms also store and insure bullion.

Picking Your Stockbroker

If you happen to be picking a stockbroker for the first time, a good way to begin is with some solid recommendations.

Ask your lawyer, accountant, or banker for the name of a stockbroker, or a brokerage firm, that could take on your account.

Some investors suggest choose several brokers, different firms and let each handle a part of your portfolio until you decide on the right one.

The broker you choose should have a philosophy about investment that close as possible to your own. Find out how

WHICH WAS PRINTED ON WHICH ON OUR

computer you already own: the Macintosh. (Either the Macintosh Plus, the Macintosh SE, or

the Macintosh II with any hard disk.)

This arrangement also means the PLP is much more compact than other laser printers. (An almost diminutive 16" x 16 1/2" x 9")

And having fewer parts, much less likely to need repairs.

THE PROOF IS IN THE PRINTING.

As you can see, a case could easily be made for buying the PLP on economics alone. But that would be selling it short.

Because the ultimate measure of any printer is how well it prints.

**GENERAL
COMPUTER**

I expect better, more-intelligent integration of desktop publishing and databases for things like printing phone books or catalogs.

the past we put together spreadsheets, word processors, and database managers. Today there are new integrated categories: we may start seeing programs that can take a blank form received in the mail, scan it in, and then fill it out by recognizing the fields and retrieving the information. Or take a filled-in form and scan it with all its data right into the database. I expect better, more-intelligent integration of desktop publishing and databases for things like printing phone books or catalogs.

Have you noted any changes in the Mac community?

Yes. The coat-and-tie ratio. That is, the number of people that come to the Mac-

world Expo in a coat and tie. In the old days you knew everybody personally. Now there are big corporations, and people in coats and ties. There's still a glimmer, though, still some Macintosh personality. At PC Expo there's zero.

Do you see parallels between the 1982/83 IBM PC boom and what is going on now with the Mac?

Yes and no. Reaching the \$1000 price for an IBM PC clone set off the PC boom. The Mac boom is due to functionality. The Mac passes a threshold of performance in certain applications.

There are some similar areas. Personal computers have begun to enhance basic things that we all do every day. They're becoming things that we have to have in an

office or a business, like a photocopier or a cash register.

How do you view the conflict between Microsoft Windows and the Macintosh operating system?

As a software publisher, we recognize that both systems are viable. The user's choice between them is going to depend on things such as installed base in the user's company, or the system's price, or the user's desire to use a particular piece of software. Remember that there are ten times as many PCs as there are Macs. Frankly, I use a PC more than a Mac because I started with it, and I'm more fluent with the PC. It's like speaking a language. I have years invested in it, and the change-over would be too costly. If the PC is perfect for my application, why should I switch?

How do you characterize the two operating environments: the Mac and the PC?

Windows is becoming faster, closer to the Mac. The problem with Windows is the

HARRIER STRIKE MISSION II

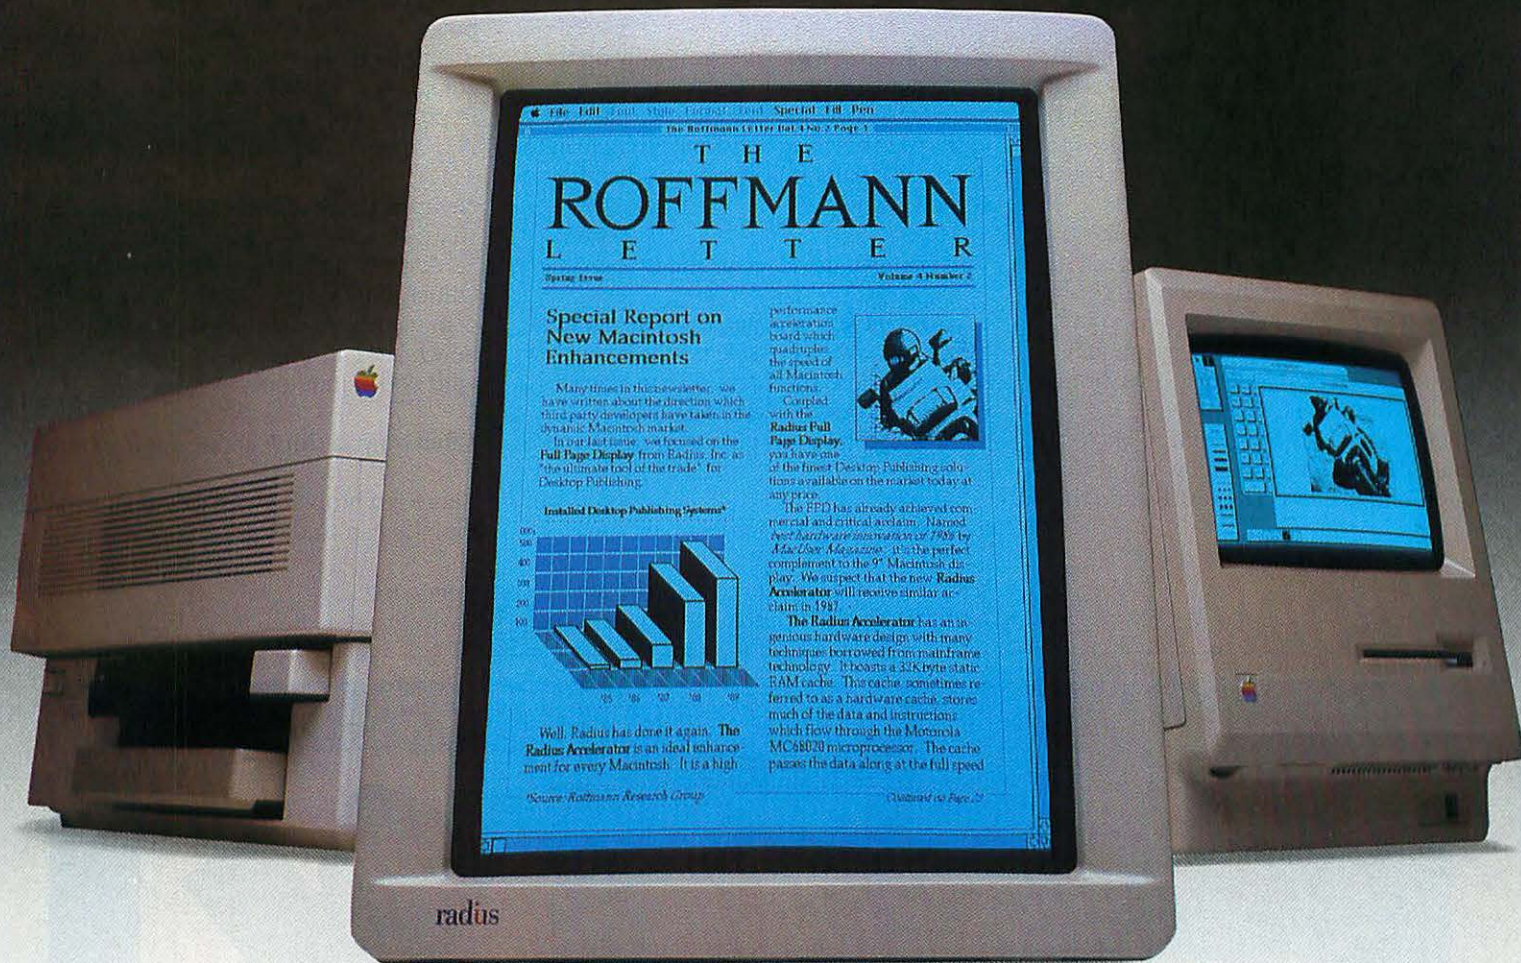

Harrier Jump Jet Flight Combat Simulator

NOW SHIPPING!

The long-awaited sequel to the original Harrier Strike is now available, and doesn't stop at mere compatibility with the new Macintoshes—it's a whole new game! Pilot a modern jump jet with weapons of tremendous power in six unique scenarios: enjoy the scenery or take off into five different full-blown battles. Face up to a dozen of the enemy's deadliest fighter jets, tanks, aircraft carriers, destroyer patrol boats, and more. Realistic fill-in graphics and authentic digitized sound. **Fierce combat action in a realistic Harrier Jump Jet Flight Simulator.**

Miles Computing, Inc. Entertainment Software Division, 7411 Alameda Avenue, Suite 2, Carlsbad, CA 92009 • (619) 331-1411

The Ultimate Tool Of the Trade.

If you want to do your own Desktop Publishing you need a Macintosh™ computer and a LaserWriter® printer.

They are, after all, the standard tools of the trade. But if you're truly serious about Desktop Publishing, you need the ultimate tool of the trade: the Radius Full Page Display™ (FPD).

With an FPD you can see a full 8½" x 11" page at one time. Without scrolling through or reducing your document. Which means you work a lot faster. And now, on your SE or Macintosh II, you can pan across two pages at a time.

The FPD's 640 x 864 pixel screen provides a flicker-free, stable, virtually paper-like page and a rich high-detail picture. Although its screen is 8½" x 11", its footprint is only 11" x 14", which means the FPD gives you a bigger screen, not a smaller desk.

Easily installed on a Macintosh Plus, SE or Macintosh II, the Radius Full Page Display is compatible with all standard Macintosh software. Which means your software investment is safe. In fact, it's actually more valuable.

The FPD is not a replacement for the screen in your Macintosh. It's an enhancement. Because the FPD actually works in combination with the internal screen in your Macintosh.

But, no matter what application you're working in, you'll work faster, smarter and more productively. And print a lot less because you can see full pages as you design them.

With PageMaker, you can use the FPD for page layouts and the Macintosh screen for your tools.

In Microsoft® Excel, you can place a spreadsheet on your FPD and a linked graph on your Macintosh screen.

The Radius Full Page Display has achieved

critical acclaim from both enthusiasts and the trade press.

If you review the reviews of the experts, editors and evangelists of the Desktop Publishing industry, almost to a person, the Radius Full Page Display is regarded as one of the major hardware advancements in Desktop Publishing.

The FPD was designed by key members of the original Macintosh team. It preserves the design integrity of your Macintosh.

For serious Desktop Publishing, it is the ultimate tool of the trade.

Circle 577 on reader service card

radius™

For the name of the Radius dealer nearest you call 1-408-434-1010.

If PCs are so much cheaper, the Mac will miss out on a large share of the entry-level market.

retrofit issue. When Apple comes out with a new Mac you can retrofit the old Macs with new system software and boards: there is an upgrade path. The Mac also has the advantages of its graphics interface and ease of learning.

IBM has no control over its market, so continuity of systems and software is a big issue. IBM looks at a market as a large automobile manufacturer does—when a machine is out of date you don't upgrade it, you throw it out or relegate it to the home.

Also, the 8088 CPU on the PC is a problem, especially for graphics. Microsoft has said that it will come out with products for high-end users—on the 80286 and the

80386. Even if *Windows* runs only on the more powerful machines, Microsoft expects it to provide a competitive alternative to the Mac because consumers will lean toward a PC that's a successor to what they already own.

Will you still develop for the PC?

Yes. About two years ago the Mac market took a dive. We were safe because we also had general PC products. So the Mac is wonderful, but the PC has a place in the market, too. You can go out and buy one for \$600.

Does the Mac cost too much money?

Yes. There is no low-end Mac. The Mac is best with the first-time user—I have no hes-

itation in recommending a Mac for people just entering computing—but those first-time users don't want to spend \$1500 when they can go down to the local Radio Shack and buy a PC clone for \$600.

Until there's a Mac available for under \$1000 we won't see it sold as an impulse buy, or as the child's first computer for school. The truth is that *any* personal computer provides more productivity than an unaided person had before. For a new computer user then, the relative difference in productivity between the Mac and the PC is small, unless it's in a special area such as DTP on the Mac. If PCs are so much cheaper, the Mac will miss out on a large share of the entry-level market.

At T/Maker, we work with both machines, but everyone in the company except me uses the Mac more than the PC. Few firms can afford to provide employees with two computers.

What do you think about Apple's future?

There is a problem with a company that big. You can't judge its tomorrow by the

Your Reasons for Buying Radius Have Just Doubled.

Radius Two Page Display and Tear-off Menus

From the makers of the Radius Full Page Display™ comes the Radius Two Page Display™.

The Two Page Display for the Macintosh SE is just what you'd expect from Radius: innovative technology that is totally Macintosh in look, feel and spirit.

When you first turn on the Two Page Display (TPD), you are in a sea of open white space. An almost infinite canvas for your imagination.

Desktop Publishers can work across two 8½" x 11" facing pages.

Engineers, architects and designers can create full-scale B-size drawings.

The 19" high-resolution monochrome screen yields an impressive 1152 x 864 pixels with a consistently stable image which shows flicker-free, paper-like pages.

The refresh rate is so fast that eye strain and

fatigue are virtually non-existent. Graphics are crisp and clear. Text is clean and inviting to read.

But the Two Page Display offers you a lot more than just a great view. With a Radius TPD, you can position menus anywhere on your screen. Or, on either screen. Tear-off Menus offer you flexibility Macintosh style.

Just scroll down to the side of any open menu, continue to hold down the mouse button, and drag the entire menu to any position you like.

Which means menus become windows unto themselves. And big timesavers when doing detailed graphic work.

To remove a Tear-off Menu from the screen, treat it like the window it is. Just click the close box.

While you're looking at the Radius TPD, take a glance at the Radius Accelerator™.

The Accelerator quadruples the speed of all your Macintosh applications. And, you're assured of total compatibility between your Radius Accelerator, Radius Display and your Macintosh. They're made for each other. By some very special people.

Every Radius product is designed by key members of the original Macintosh team. Hence the painstaking detail to both Macintosh electronics and Macintosh aesthetics.

After all, we have a very special heritage to live up to.

Which is why Radius is rapidly earning acceptance as the industry standard.

And that's just one more reason why you should visit your Authorized Radius dealer.

Today.

radius™

*Fonts are a tough market....
Type is not intuitive to the
general computer user.*

products it produces today. Especially when there have been so many senior-management changes in the company. I'm certain there is no longer the same sense of spirit at the company there once was; it has lost personality. At the tenth anniversary party one of the primary topics of discussion was the stock price, not the technology or the people. I wouldn't want my company's future tied to Apple, or to any one company, for that matter.

You work with both NeXT (Steve Jobs's company) and Apple, despite a certain animosity between the two. How do you manage that successfully?

We haven't completely avoided all problems. I'm sort of a Hong Kong between China and Taiwan. Each side has value to the other, but they're not speaking. Politically we serve as a conduit—Steve couldn't have published *WriteNow* himself. What would he do—go to Macworld Expo and do demos in Apple's booth? I don't even know if Steve drives through Cupertino these days.

I remember once talking to an Apple product manager who said that he hated seeing royalties on a great Mac product like *WriteNow* going into Steve Jobs's pocket. There is no way to answer comments like that.

Nevertheless, a lot of respect remains between the two companies. The people who wrote *WriteNow* are at NeXT, yet they identify with the Mac and are proud of what they did for an Apple computer.

At first some people at Apple were afraid I would take their prototype equipment and deliver it to Steve, but those suspicions have passed. They recognized that we have nondisclosures on both sides, and a lot of integrity about that. And Steve Jobs is not really interested in what the next Apple machine will be. If he did want technical information, I'm sure he has better sources for technical detail than T/Maker.

What is the impact of Apple's bundling HyperCard with the Mac?

The impact depends upon what a company publishes. Apple used to bundle *MacWrite* and *MacPaint*. That was great for T/Maker, because then all owners of the Mac could use our *Click Art*. But there wasn't any market for third-party word processors or paint programs.

It's not a question of whether Apple should provide software, but rather what kind—enhancements to the system or true applications. The system improvements enhance consumers' ability to use the machine, but application development stunts third-party development.

Will a third-party industry develop to provide HyperCard stacks? Or will stacks be akin to shareware or desk accessories?

If there is a market for clip art, there is a market for stacks.

Low-volume or accessory software is something someone can always make money from. Maybe not Lotus, because of the investment it has to make in a product, but smaller companies may have profitable applications.

T/Maker was one of the first companies to offer fonts for the Macintosh. What direction do you see for fonts?

Fonts are a tough market. The user is not as interested in buying a specific kind of typeface as we imagine. Type is not intuitive to the general computer user. The average person working with type uses whatever is available; most don't understand the value of different fonts, when to use them, when to mix them, and so on.

We sell both bit-mapped fonts and laser fonts. Today most font sales are for laser fonts. We still sell a lot of bit-mapped fonts to people with ImageWriters who want to make flyers or invitations. But Adobe has a lock on the high-end font market today; it has some proprietary algorithms, which allow it to make the best laser fonts.

See your nearest Authorized Adobe Dealer or call (800) 29-Adobe. In Alaska and Canada, call (415) 961-4440. *Make a difference with the Adobe Type Library.*

ADOBE
SYSTEMS INCORPORATED

All products are registered trademarks or trademarks of their respective manufacturers.

If it makes a difference, make a difference with the Adobe Type Library.

The difference is impact.

Using just a few typefaces for everything you do is like wearing the same suit to work everyday. After a while, nobody notices.

But with over 200 typefaces in the Adobe Type Library, it's easy to call attention to everything you do. You can "shout" in a bold display typeface to gain immediate attention. Or "whisper" in delicate typefaces to communicate a mood.

And no matter which Adobe typefaces you choose, you're always getting the best quality. Because each typeface is

researched and refined to assure that it's true to the original design. And that it's sharp and reproducible whether it's set as a footnote or a headline.

So why limit yourself? Call now for details on the Adobe TypeLibrary: 800-29-ADOBE; in Alaska and Canada, call 415-961-4400.

Because no matter what type of design it is, nothing makes a difference like Adobe type. Adobe Systems Incorporated, 1585 Charleston Road, P.O. Box 7900, Mountain View, CA 94039-7900.

ADOBE
SYSTEMS INCORPORATED

The more fonts people use, the more troublesome it is to design OCR software that reliably recognizes the letterforms.

What about OCR (optical character recognition) software?

Well, the more fonts people use in documents, the more troublesome it is to design software that reliably recognizes the letter forms. Right now it's becoming easier to share information electronically, so I actually see less call for OCR. You just modem a file to someone or send a disk, rather than worrying about whether your company's particular OCR system will read particular fonts.

Your company was also one of the first to produce clip art. What's going on there?

People want more selection at higher resolution. We thought that when scanners became more prevalent, clip art would falter.

But having scanners doesn't change a user's ability to input or create quality original art. Scanners are also still expensive. They're quite slow, and it's difficult to make them do what you want.

Our latest clip art is all done with *Adobe Illustrator*. We even chose the same artists Adobe used for its documentation illustration so that our art would be of the highest quality. The laser printer output from this *Illustrator* art is much better than the stuff done with scanners.

Even our bit-mapped packages are designed directly on the Mac with specific resolution and smoothing in mind. Our artists have been doing it that way for three years—I think the resulting images print far

better than any scanned-in art of equivalent resolution.

Clip art is funny. There are no barriers to entry—anyone can buy *MacPaint* and a Mac and become our competition—but the questions of product quality, recognition, and breadth of distribution are important.

What are your biggest requests?

Christian images were our number-one request, and our latest package satisfies that demand. Sometimes here in Silicon Valley we think that we're the heart of the universe, but we're really not representative of the world. Religion is a bigger interest elsewhere.

Military and industry is another hot area. But it raises a moral question—whether I want T/Maker to support war efforts by providing clip-art disks of little hand grenades and rockets.

Pornography?

No, we wouldn't do that. Not a company with as many women in it as this one. In fact, *Macworld's* advertising department

Clone Your Modem

For less than the cost of another modem, you can offer telecommunications services to everyone on your AppleTalk® network. With ComServe™, you no longer need a modem at each Macintosh™—with all the accompanying wiring complexities and line charges.

- Gain network-wide access to modems, mainframes, and minis.
- Eliminate dedicated hardware. ComServe transparently runs in the background of a Mac. And, it's AppleShare™ compatible.
- Save, at \$195 per server. Share expensive, high-speed modems.

Call now or ask your dealer for ComServe. From Infosphere, the only full-family AppleTalk software vendor.

4730 SW Macadam Ave — Portland OR 97201

How Jasmine turned SCSI into a Moving Experience.

You're definitely going to want to move up to MegaDrive—the high speed, SCSI storage device featuring removable 10 megabyte MegaFloppy™ disks. Besides being servo-written and fully interchangeable between MegaDrives, MegaFloppy disks are much more reliable than other removable, mass storage products. In addition, they are easily stored for safe-keeping/security.

MegaDrive is a moving experience for any Macintosh user. Desktop publishers can store fonts, clip art, layouts, and different clients on separate disks. Musicians can use it to catalog sound libraries and samplings.

And the everyday user can finally organize all those floppy disks that have been piling up for so many years. MegaDrive is also a fast, reliable back-up system which allows you to work directly from your MegaFloppy back-up disks in the event of a hard disk crash. Better still, everything's backed by a full 1-year warranty. And the high level of service and support you expect from Jasmine.

MegaDrive \$999

Verbatim

In an ideal world there would be software to convert bit-mapped clip art into vector outlines, or to fill in gray scales.

wouldn't allow us to print an ad with a *Click Art* version of Michelangelo's David, so we put in a fig leaf for the ad.

What is the difference between PostScript/Illustrator clip art and bit-mapped clip art?

If you output our recent bit-mapped *Click Art* on a LaserWriter without altering the size, you couldn't tell the difference between bit maps and PostScript art. Of course, there's no gray-scale shading with bit maps.

The trouble with EPSF clip art is that it can't be used in all applications today. But it's increasingly needed in design and CAD. In our PostScript products, we try to create things that can't be done well in other formats.

PostScript provides advantages for sizing. We've enlarged an image so much that it takes up to nine pages, and it looks just as good as when it's printed in a small size. So we've tried to develop the most useful and popular PostScript images.

Will you do more PostScript-based clip art?

I think so. We find that the individual user wants a large selection of pictures. We have 125 images in the current collection. That brings up the other problem with EPSF: it takes a lot of disk space. Some of the images are so big that they won't fit into the Mac's memory for DTP placement. Most people seem to think the EPSF files are smaller than bit maps, but the EPSF file has all the bit-map information *plus* the PostScript information.

What about high-quality color clip art?

There is always a segment of the market that wants the best and the latest, but the average consumer wants images that print on the LaserWriter and the ImageWriter and can then be photocopied—in other

words, no color. We're a consumer software company. The average guy doesn't buy the high-end products.

Is there a market for clip art on CD ROM?

There is an interest, but it is not an immediate focus for us. That's a high-end market, and ours is a general market. As soon as there are more CD ROM drives out there, we'll pay more attention. *Click Art EPS Images* is our first foray into the high-end market.

How about gray-scale clip art?

There are two kinds of clip art products: building blocks for the design professional and finished images for consumers who don't want to spend time designing art. In an ideal world there would be software that could convert the bit map into vector outlines or that could fill in gray scales for vector-based clip art, depending on what the user wanted. But that's not easy to develop.

How long before it's possible to convert bit-mapped images to outlines for LaserWriter output?

Remember that this kind of software will have to compete with what the eye and brain can do—simple things like distinguishing between a square and a circle that are interlaced. An eight-year-old can make that distinction, but it is very difficult for the computer. Add gray scale and noise, and the task becomes much more difficult. The eye automatically filters out the noise. How do you get a computer to recognize what makes up a face? Then there's image complexity. This is going to take some complex code. We're working on it.

INTRODUCING 101 MACROS™ FOR EXCEL™

Instead of This...

MAKE EXCEL EASIER — AND MORE POWERFUL

Now you can have your own on-disk library of shortcuts, utilities, keystroke savers and *mousetroke* savers that will work with ANY Excel worksheet. No more dull, repetitive operations, no more pulling down and clicking through multiple menus, no more hours wasted with manual input that could be automated.

Introducing the ultimate collection of 101 pre-typed, ready-to-use, all purpose macros on disk. Imagine being able to:

- Automatically double space and print a worksheet
- Set up and maintain data bases with a single command
- Create slide show presentations
- Add menu-driven financial functions
- Automatically overlay and clean up all the worksheets on the screen with a single keystroke

— Plus 96 more features to save time and multiply the power and ease-of-use of Excel.

With 101 MACROS FOR EXCEL you can save keystrokes & mousetrokes, save menu steps, save time and automate your worksheet. Whip through complicated menus and worksheet setups with a single keystroke. Eliminate repetitive operations with macros that will move down columns or across cells, changing each cell to your specifications. Operations that previously required several mousetrokes, like swapping columns or inserting rows, can now be done with single keystrokes.

With This. \$69.95 Sugg. Retail

ELIMINATE FRUSTRATION

How many times have you had to go back to the manual to learn how to do some simple function that seems overly complicated in Excel? How often have you waded through charting, database operations and building tables? How often have you wished that you didn't have to wear out your arm reaching for the mouse to perform just about every operation? The macros in 101 MACROS FOR EXCEL help you out with everything from simple mousetroke and keystroke savers, to sophisticated, interactive macros which "walk you through" more complicated Excel operations.

EASY TO USE

These macros are extremely easy to use. Just load the macro sheet called 101 into Excel and you'll have all 101 macros available for instant use at any time.

By pressing the option key, the command key and a single letter, you can insert new rows that copy data automatically. Or enter long phrases instantly. You can even toggle the gridlines and headings on and off with a single keystroke combination.

EASY TO LEARN

101 MACROS FOR EXCEL comes complete with a comprehensive, step-by-step manual that includes a short tutorial chapter and explains each of the macros and how to use them. The macros are fully documented, so they're easy to review, change and learn from — which gives you an excellent starting point for writing your own custom macros.

You Can Do This...

FREE! HANDY REFERENCE GUIDE

Act now. For a limited time you get not only a complete collection of 101 macros with User's Manual, you will also receive a handy reference guide listing all 101 macros and their call-up keystrokes.

"Outstanding... the ultimate macro library."
— P. Antoniuk, President, Solar Systems Software
"A must-have for Excel users."
— E. Sharp, President, Clarity Glass Inc.
"A great idea... what a time-saver!"
— A. Stein, President, Studio Silicon

How To Ship U.P.S.™ Without Paying For The Truck.

Daytona Beach, Fla.

It all started one day around 4:30 p.m.. As I sat in my office, I could hear the rumbling of the faithful UPS truck backing up in the shipping area. I felt sorry for the driver. We had a large shipment of heavy boxes that day and the temperature was in the 90's. The driver and our fulfillment manager were in for at least an hour of filling out forms.

That's when it hit me! Here I sit in front of my Mac, there's another Mac in accounting, one in customer service, and even one at the reception desk. **But we don't have one in shipping!**

"Surely someone has figured out a way to save time and money by using a personal computer for shipping". So I picked up the phone and called United Parcel Service. I learned that there are currently 22 UPS approved computerized shipping systems available. They range in price from \$5,000 to \$16,000! What you end up getting is some huge, expensive system with a whole bunch of hardware and software. (And as you've probably guessed, the systems are very IBM'ish.)

Undaunted, I continued my search. My Mac had slain the IBM Goliath in accounting, production, and customer service. It could do the same in shipping! **THE ANSWER.**

I didn't want to pay \$16,000 for a computerized shipping system. For that much I could buy my own UPS truck! The answer came in the form of a unique program called PWI ShipMate™ by Positive Works, Inc. It is designed for both the large, frequent shipper, and also for the occasional shipper. It's priced so that even individuals can afford it. The entire price is only \$295, and best of all, it was designed for the MacIntosh. It does everything that the big systems do, except that you provide the computer and the scales. It does the rest.

SAVE TIME AND MONEY

No more forms to fill out by hand. No more charts or tables to look up. No more labels to fill out. All is done automatically at the touch of the mouse. PWI ShipMate™ fills out all tags, COD, AOD, manifests, and shipping labels. Paper work that used to take hours can now be accomplished in minutes. This software literally pays for itself in a matter of weeks by saving hundreds of man hours.

In addition, this unique program compiles complete customer files with all current data. The customer filing system boasts an auto lookup function that stores and retrieves information on all frequent shipments and customers.

Not only does PWI ShipMate™ do all the paperwork, look up all the zones, and figure all of your costs, it even helps manage your business. As a special feature, PWI ShipMate™ generates timely reports. It automatically keeps track of how much you're spending per day, per month, per year, etc. In addition, it calculates a cost comparison and graphically shows you how much you would have spent if you had sent the same packages by 2nd day air, by ground transportation, etc. You instantly know how much you are spending by date, by zone, by unit, and even by shipping method.

PWI ShipMate™ is fully approved by United Parcel Service and will handle all domestic and international shipping needs. **TO ORDER**

PWI ShipMate™ is available for \$295 (or \$449 w/ Filemaker Plus) from Florida Mktg. Int'l., Inc. 142 Cone Rd. Ormond Beach, Fla. 32074. To order by credit card call 904-677-1918. You will need to have a working copy of Filemaker Plus™ to work in conjunction with PWI ShipMate™. Complete documentation, users manual, and customer support number are included with your program.

Verbatim

What do you think about some of the new non-PostScript hardware and software that will compete with Adobe Illustrator?

The key to competition is price/performance. If there is similar performance—that is, if the output you get from PageMaker (or your program of choice) is the same whether you use a LaserWriter or a GCC Personal Laser Printer—then you'll buy the cheaper printer.

I don't think that Apple's old customers (back when GCC's HyperDrive was the only hard disk) were brand-name shoppers. But now that Apple is selling to big companies, maybe the six-color logo on the box will mean something.

Why are there so few women professionals in this industry?

I don't know. I haven't found many barriers because I'm a woman. Most of the developers are glad to see a woman here.

Is it a problem or an advantage?

Both. A lot of this business is predicated upon personal relationships. Being a woman helps and hurts. Some people tend to remember me more than they might otherwise because I'm a woman. When it hurts, I have to pull out my Stanford MBA credentials to get my foot in the door.

What do you consider the burning issues in the market now?

For us there is the issue of whether or not a company our size can survive, or do we have to be big to stay in the market? Look at Living Videotext, Forethought, and other companies with a high profile in the Macintosh market that have been swallowed up.

We don't want to be acquired. We enjoy what we do here. So it would be great if it could go on as it has been. I have the best of jobs—a small group of the best people, lots of profit, different projects to work on. But if the industry changes too much, that may not be possible. There is a consolidation of our industry at present, and almost a consolidation of customers as well.

We're always evaluating our options. If remaining small becomes impossible or if the industry changes further, then we'll gladly pursue relationships with larger companies. We have products and talents that I'm sure could certainly benefit some of them. □

Interviewed by Jerry Borrell

PWI Shipmate™  by Positive Works, Inc.

MacTilt SE[®]

The Mac SE sitting on the desk leaves the screen too low for comfortable operation. MacTilt SE elevates the Mac 4" and provides 30° tilt and 360° rotation for better viewing and greater operator comfort. **\$89.95**

The Muzzle[™]

The Muzzle protects your confidential files, documents, and other sensitive data. A locking bracket effectively prevents the Mac SE from being powered up, eliminating access to any data on the hard disk. The entire Muzzle can also be secured to a desk or workstation with a cable or chain to physically secure the Mac in place. **Muzzle \$49.95**
MacTilt SE/Muzzle \$129.95

Pedestal Base[™] for Large Screen Display

The same outstanding features and user benefits of the MacTilt are now available for your Large Screen Display, Commercial CRT, Personal or Portable Computer, or Graphics Monitor. Enjoy a better viewing angle and reduced eye, neck, and back strain. Call for specific models. **\$89.95-\$99.95**

Mac II Workstation[™]

Everyone who needs the power of the Mac II also needs the space that the Monitor and Processor occupy. If there is no desk space to organize work and lay out projects, the Mac II's effectiveness is limited. The new Mac II Workstation takes a totally new approach to workstation ergonomics. This free standing workstation sits alongside your desk and provides a unique arm suspension system and shelf area giving the operator the ultimate in adjustability and space savings. **\$499.95**

MacBuffer LW[™]

MacBuffer LW increases office productivity by eliminating the need to wait for the LaserWriter. This means that every operator on the network can send MacBuffer LW their print jobs and get back to work. MacBuffer LW can handle unlimited Macs and LaserWriters, provides for full queue management, and is totally transparent to operators. Available in 1,2,3, and 4 Meg models. Call for pricing.

MacTilt[®]

With a silky-smooth, one hand motion, your Macintosh can be adjusted to relieve operator stress, ease neck, back, and eye strain, and increase productivity. The MacTilt elevates the Mac 4", and provides 30° tilt and 360° rotation at the touch of a finger. **\$89.95**

Mouse Cleaner 360[™]

By regularly cleaning your Mouse, you can eliminate sluggish operation and expensive repair bills. By removing the grime from the tracking rollers, free cursor movement is quickly restored. Compatible with IBM, Apple, Atari, Amiga, Microsoft Mouse, and others. **\$16.95**

MacBuffer[™]

If you are an Imagewriter user, MacBuffer will automatically reduce the time the Macintosh spends waiting for the printer. In addition to less time spent waiting, MacBuffer enables two Macs to share one printer and has Local Copy and Single Sheet Mode. Get the most out of your Imagewriter I or II with MacBuffer. Call for pricing.

MAC™ File Server

For Apple Macintosh™ Network Systems
For Tops™, Appleshare™ and Macserve™

Now, for your office automation the FS-100. The FS-100 is a fileserver which comes with a hard disk (261MB) and a 45-60MB tape backup built into it. It is the latest in disk technology combined with the industry standard SCSI interface which offers optimum performance for your total network! The FS-100 is excellent if you use Tops™, Appleshare™ and Macserve™.

Features:

- Built-in 45-60MB tape backup with 90KB/Sec transfer rate
- Built-in 261MB hard disk with 23ms access time
- Weighs 86.1 lbs./39kg
- Dimensions 22"x10"x24" fits under a desk!
- SCSI interface
- Perfect for networks like Tops™, Appleshare™ and Macserve™.

\$9,999 For 260MB System
\$13,995 For 485MB System

Hard Disks for the MAC™

These high quality hard disks range from 20MB to 90MB. They come with a built-in SCSI intelligent controller and can transfer up to 1.5MB per second and are either MFM or RLL.

Features:

- 5.5"x7"x15.5" portable
- SCSI built-in interface
- MFM/RLL recording method
- 65ms or 40ms
- Built-in power supply
- Disk utility and software included

Price:	External	Internal
20MB 65ms	\$649	\$445
40MB 40ms	\$949	\$899

CLUB

American Technologies, Inc.

Mac Division

3401 W. Warren Ave., Fremont, CA 94539

Macworld News

by Gil Davis

Hear ye, hear ye. All rise. Here comes the judge. He's Harry Anderson of NBC's "Night Court," whose somewhat zany—and Macintosh-infused—private life is a lot like his loony character's.

Night Court

Harry Anderson, better known as Judge Harry T. Stone of NBC's "Night Court," is also a magician and sometime Macintosh evangelist. Anderson has done magic tricks and street performing in North Hollywood since he was 16, and his exploits with computers also go back several years. He bought a VIC-20 on impulse, then a Commodore 64 and an Apple IIe. Next Anderson bought a Macintosh, and he's been a diehard Mac user ever since. He currently has 14 Macs,

including a Dynamac and an SE, which he uses to keep his various projects and enterprises up and running. Live-stock Productions, Anderson's production company, named for the magician's trick of pulling a rabbit out of a hat, and Anderson's Illusions, a magic and special-effects division (which turned a can of 7-Up into a basketball in a commercial with Magic Johnson), keep the stable of Macs in use.

Anderson even has a Mac in his trailer on the "Night Court" set, equipped with a modem so

that he can communicate with his office. He uses the Mac to write and storyboard episodes of "Night Court," specials for NBC TV and HBO, and a book entitled *Games You Can't Lose and Bets You Can't Win* for Simon & Schuster.

Anderson's evangelism for the Mac carries over to other members of the "Night Court" team. He has convinced several of the actors and crew to buy Macs. And if you look closely as the camera pans Judge Stone's office, you'll see a Dynamac perched on a desk. The on-screen and off-screen characters share the same passion.

Beyond the Mouse

The mouse was once hailed as a revolutionary input device. Nevertheless, it still represents an imperfect liaison between the Mac's screen and the most intuitive input device of all: the hand. Three companies have recently demonstrated devices that provide a more direct means of manipulating information on screen.

Perhaps the most direct approach comes from MicroTouch Systems' Mac & Touch Screen, which enables you to use your finger to choose menu items, click on-screen buttons, and select and drag objects on a Mac Plus, an SE, or a Mac II.

Before this can work, a sheet of glass with a resistive coating must be placed over the Mac's screen. The touch-sensitive sheet controller senses the position of a conductive object—such as a finger—and records the position on a grid of 1024 by 1024 touch points.

In addition to offering a more natural interface than the mouse, a touch screen takes up no desk space, making it more convenient for public demonstrations where a mouse might be damaged or stolen.

A touch-sensitive screen is fine for dragging objects and pressing buttons on a flat surface, but imagine plunging your hand into the Mac's screen and moving objects in 3-D space.

The DataGlove Model 2 from VPL Research introduces a re-

- Suggested Retail Price \$195

MacroMind has been making the Macintosh look great for years. Now let us make you look great with VideoWorks™ II! The Overview window creates slide shows that can include animation, wipes, fades, timers or sound. VideoWorks™ II works great with the Macintosh II (in either 16 or 256 colors) or the Macintosh 512, Plus, SE.

Create animation on your Macintosh with VideoWorks™ II. Take any artwork you have and create animated presentations, storyboards, educational courseware, point of sale displays or music-videos. From MacroMind® Inc., the creators of MusicWorks™, M.U.D.™, Art Grabber™, ComicWorks™, GraphicWorks™, Maze Wars+™.

Original VideoWorks owners can upgrade to VideoWorks II for \$100. Send your check, VISA or MC order along with your VideoWorks Movies disk.

VideoWorks II

VideoWorks™ II © 1987 MacroMind™ Inc., 1028 W. Wolfram St., Chicago, IL 60657 (312) 871-0987. Comes with three disks: Program & Tutorials, Clip Animation, Artwork & Movies and a Guided Tour training disk. Not copy protected. Distributed by Brøderbund Software. Ask your local dealer.

Circle 781 on reader service card

markable user interface for simulating motion in three dimensions. The DataGlove is just that—a glove that senses hand gestures and transmits them to an image on the Mac's screen.

The glove is connected to a control unit that contains a position-and-orientation system, which records hand and finger movements. When you wear the glove and move your hand, a representation of a hand appears on the screen, duplicating your movements in real time.

The DataGlove can be used in areas such as human-factors engineering (the science of interfacing humans and machines) and telerobotics. It has already been used in conjunction with 3-D animation software from SimGraphics Engineering to simulate the movements of astronauts and equipment in a proposed space shuttle module. The DataGlove Model 2, which operates with the Mac Plus, sells for \$8200—a small price to pay for this type of simulation in the microcom-

puter world.

Another unusual interface comes from Anatex. *Personal Writer 15* is a handwriting recognition system that translates written letters into typed text on the Mac's screen. The system works with word processors, graphics packages, spreadsheets, and page-layout programs.

Personal Writer comes with a digitizing tablet, a pen, and software that "learns" your handwriting. Numerous handwriting files can be saved, allowing more than one person to use the interface. As you write a word or phrase on paper, the text appears on the screen.

Two versions of the system are available: *PW 15 S* requires you to print letters in a grid format; the more flexible *PW 15 SL* doesn't restrict you to the grid. In addition, *PW 15 SL* not only reads your handwriting, but corrects your spelling with a 100,000-word dictionary. *PW 15 S* sells for \$895, and *PW 15 SL* for \$1395.

To some, returning to hand-

Designing an alphabet on MacIkarus is a matter of pushing and pulling on "handles" located on the font's outline.

writing might seem a step backward; but to others, drawing and writing with a pen instead of rolling a mouse and pecking at a keyboard might be the natural way to compute.

For more information, call MicroTouch Systems in Woburn, Massachusetts, at 617/935-0080; VPL Research in Redwood City, California, at 415/361-1710; and Anatex in Los Angeles at 213/556-0151.

—Erfert Nielson

So it didn't go unnoticed when Ikarus software modules were displayed on a Mac II at the Seybold Desktop Publishing Conference in September.

According to The Company of Boston, which represents the developer, URW of Germany, *MacIkarus* is a trial balloon to see if people want a Mac II font-design system that has a worldwide reputation and 1563 associated fonts—which is probably two to three times the number available from most other suppliers.

Font design begins with the display of a single character, which is then modified to suit the designer. Key parts of the resulting character—such as serifs, points, and accents—are automatically stored and carried over to the rest of the alphabet.

You can modify individual characters with the Ikarus editing system by placing points on the font's outline that can be dragged to new positions to create a new curve. The basic alphabet can then be expanded, condensed, italicized, changed in horizontal proportions, or given an outline and shading.

In addition, General Computer recently introduced Fonts

(continues)

Count 'Em, 1563 Fonts

Everyone familiar with desktop publishing is aware of the importance of fonts. But to some people, fonts are of particular interest. Graphic artists may have demanding clients who need a specialized font for their company's logo, or a publisher may want to use fonts to give a publication a particular "feel."

Up to now, most font-design systems have cost \$100,000 or more, which is why there are currently only 40 Ikarus font-design systems in the world.

The DataGlove band can rotate a 3-D Mac image through three dimensions. More practical uses include remote-control handling of hazardous materials.

OVER 15,000 DESKTOP PUBLISHERS MADE MICROTEK #1.

More sophisticated desktop publishers are using Microtek desktop scanners with their IBM-PCs and Macintoshes than any other. This was true in 1985, 1986, and is still true in 1987! Several independent surveys have verified this*. Over 15,000 have chosen Microtek manufactured scanners.

Why do more people choose Microtek? One reason is Microtek's product "family." You can choose from four different image scanners; plus Optical Character Readers; plus Fax communication tools; plus Raster to Vector conversion software.

*International Data Corp. and Dataquest reports.

Macintosh is a registered trademark of Apple Computers, Inc.
IBM is a registered trademark of International Business Machines Corporation.

Our family gives you room to grow with the confidence that all members will work together.

Another reason why over 15,000 desktop publishers have made us #1 is that Microtek products are more reliable, and more feature-rich than others. You can count on receiving more capability for your money with

Microtek. We are the choice of the serious user! Contact your local Microtek Dealer or call us to see why.

Circle 714 on reader service card

Plus-16 additional fonts for its 300-dpi Personal LaserPrinter, which uses QuickDraw as a page-description language (an AppleTalk connection is in the works). Fonts Plus lists for \$299 and includes two additional headline fonts, Futura Extra Black and Cooper Black, plus five other fonts, ITC Avant Garde, ITC Bookman, Century Schoolbook, ITC Zapf Chancery, and ITC Zapf Dingbats.

Adobe Systems has also announced six new typeface packages, bringing its Adobe Type Library to 147 individual fonts. The average price per package is \$185.

CasadyWare's most popular font is now Calligraphy, which is compatible with PostScript. For \$69.95 (list), you receive Regency Script and Calligraphy Laser in 14-, 18-, 24-, and 36-point sizes, plus tips about how to install and use the extra fonts. For more information, call The Company in Boston at 617/439-5346; General Computer in Cambridge, Massachusetts, at 617/492-5500; Adobe in Palo Alto, California, at 415/852-0271; and CasadyWare in Carmel, California, at 408/646-4660.

Speeding Up Your SE

Accelerator boards are typically used in image and signal processing, high-resolution displays, 3-D solid-color graphics, artificial intelligence, and large relational databases.

Up to now, adding an accelerator board to your Macintosh SE cost \$995 to \$1899. But now you can speed up your SE using MacMemory's \$599 Turbo SE. Although it uses basically the same 68000 processor normally found in the Mac SE, it runs at twice the speed—essentially doubling the SE's performance.

Turbo SE doubles an SE's speed, giving users a taste of high performance. Add a math coprocessor for fast calculations.

For \$399, you can obtain even more speed. According to MacMemory, plugging a Motorola 68881 math coprocessor chip into the Turbo SE board allows programs that use the 68881—such as *Microsoft Excel*—to run up to five times faster during calculations. Pure math computations have reportedly been clocked at 60 times previous speeds.

Levco's \$395 CacheCard and the Turbo SE function similarly, except that CacheCard also includes a 16K RAM cache that feeds the most frequently used instructions and data directly to the 16-MHz processor rather than to the much slower processor on the SE's system board.

At the high end of the accelerator-board market is Levco's TransLink parallel processing system, which puts the power of the VAX 8600 mainframe into the SE or the Mac II. The heart of the TransLink system is the INMOS Transputer—a high-speed, 32-bit parallel processor with a throughput of 10 million instructions per second (MIPS), in comparison with the 2.5 MIPS of the standard Macintosh II. Multiple Transputers can be plugged in to create a supercomputer throughput of 200 to 300 MIPS, according to Levco.

A TransLink starter kit retails

for \$2499 for the Mac II and \$1899 for the SE, and includes a software tool kit. Additional Transputer modules cost from \$1299 to \$3499, depending on the module's clock speed; memory; and optional on-chip, floating-point math coprocessor.

For more information, call MacMemory in San Jose, California, at 408/922-0140; INMOS Corporation in Colorado Springs, Colorado, at 303/630-4000; or Levco in San Diego, California, at 619/457-2011.

Shhh, Don't Tell the Competition

Harvey Andres has kept his secret weapon secret about as long as he can. Now the word's getting around to the competition that

he's using a Mac to win contracts in an unusual way.

Andres—of Andres and Associates in Bethel Island, California—bought a 512KE two years ago to create client mailing lists. Soon after, he began experimenting with *MacPaint*.

Before long he realized he could use the program to design food- and beverage-industry processing plants. With *MacPaint* Andres could easily depict conveyor belts, bottling machines, and their enclosures, and then print the results on an *ImageWriter*.

It was a good idea that got better when Andres began taking his Mac along when he visited clients. "We need three more feet between the conveyor and that wall," a client might say. Andres would turn to his Mac and make the change within seconds, satisfying his clients because their plants were designed "their way."

Andres calls his secret *client-aided design*. But it's not a secret anymore.

Harvey Andres wasn't shy about his new Mac, so he took it along when visiting clients. Everything went fine till one crusty worker shouted, "Are we buying a conveyor line or a computer?"

We were ready for the Mac II almost before they were.

INTRODUCING THE NS8/16 MEMORY EXPANSION BOARD FOR THE MACINTOSH II

National has been providing high-level add-in products for over a decade. We've helped well over a hundred thousand multi-tasking, multi-user business environments run faster and better. So even before Apple was ready with the new Mac™ II, we were ready with the expertise and technology to help it work harder.

In fact, we viewed the Macintosh™ II as an 'open' invitation to provide power users with the right tools. And now we're proud to introduce the NS8/16 Memory Expansion Board.

GET 4, 8, 12, OR 16 MBYTES OF RAM FEATURING:

- Apple/UNIX® (A/UX) compatibility.
- RAMdisk software.
- Advanced NuBus™ support.

Speed through memory hungry applications like: CAD/CAM. Desktop Publishing. High Resolution Graphics. Big

Databases and Spreadsheets. Financial/Accounting packages. And AI Programming. Just to name a few.

AND RUN A/UX MORE EFFICIENTLY

High-end applications will run at top performance levels under A/UX. Without modifications. And the NS8/16 remains completely transparent to the user.

In the Macintosh II operating system, the RAMdisk utility allows an application to treat the NS8/16 as one, or a series, of pseudo disk drives, accessing files at NuBus memory speeds.

So memory intensive applications will go much faster. As will switching between applications.

ALL WITH QUALITY AND SUPPORT YOU CAN RELY ON

Get a full 5-year warranty on the NS8/16. Backed by the leader in memory products. And customer service.

National is the company you should think of for add-in products. Now, with our NS8/16 Memory Expansion Board. And in the future — you can expect to see a whole line of add-in products for the Mac II.

It's experience that lets us make a promise like that. So now that you have the Mac II ready to run, you know who can help you see how far it can go.

Mac with Teeth

With the versatility of the Macintosh computer, good software is sometimes used for applications not dreamed of by its developers. *ToothPics* was developed by Class One Limited in Tempe, Arizona, to provide dentists with an easy way to enter their patients' information and run their practices.

ToothPics pioneered the on-screen dental chart in which a dental assistant uses the mouse to select teeth and procedures. Older systems required that all

The Macintosh helped forensic experts identify airline crash victims quickly.

entries be typed, a mistake-prone and time-consuming process.

Dr. Steven Smith, chair of Northwestern University's forensic dental section, saw a new application for *ToothPics*. Upon his request, Class One donated to the university a modified version of the program that allowed charting information to be transferred as a text file. Standard database programs could then be used to match existing dental records with human remains.

When a major airline crash occurred in Detroit, Dr. Allan Warnick, chief forensics Odontologist of Wayne County, Michigan, asked Dr. Smith and his colleague Dr. Larry Pierce to set up and run forensic computers at the crash site. Apple immediately airlifted in two Mac IIs.

The Mac IIs and several locally donated Macs were networked in the forensics hangar. The Macintosh lived up to its reputation for ease of use: volunteers were trained and charting dental records within an hour of arriving.

With the aid of *ToothPics'* charts and a list of most probable matches (generated on *4th Dimension* by database expert Forrest Lorz of Maryland), the forensics specialists began to identify the victims.

One FBI expert, upon seeing the devastation of the crash, had estimated that it would take three weeks before all the remains could be returned to the families. But in this case, the forensic team completed the crash site identifications within six days of the accident—129 of the 156 victims were identified by dental records.

"This is the first time that computer dental graphics have been applied to assist forensics in a large-scale disaster," said Class One president Bert Cutler. "We are pleased that our dental office product could be adapted and used in such a high-pressure environment.

"Forensics is not an area that one would normally associate with business software, and it has been gratifying to be able to serve these families."

Seeing Sounds

Using a Mac, it's now possible to *hear* a room even before it's built—a real advantage for acoustical engineers who might be called on to design anything from a home entertainment center to a concert hall.

Using a new program called *Modeler*, a sound engineer can convert drawings of a room's shape and information about its building materials into a model of its acoustical proper-

Tom Birkle conducts a nonexistent orchestra. No sound source is necessary because his acoustic simulation program needs only a Mac.

ties. The engineer can then alter this model to achieve a representation of the desired acoustical environment.

First *Modeler* enables the engineer to situate up to 100 groups of electronic speakers on the plans using a click-drag procedure. Speakers are positioned using three-dimensional coordinates.

Modeler then calculates direct-field, reflected, or direct-plus-reflected sound prior to producing a presentation-quality graph that superimposes a sound-pressure-level map on the floor plan. Modifications can be made to speakers, room dimensions, and materials to "tune" the room for the desired sound.

"*Modeler* makes an excellent sales tool because clients get involved in designing their own sound systems, using easily understandable graphs," says Tom Birkle of David L. Adams Associates in Denver, Colorado. Birkle codeveloped the acoustical simulation program with Bose Corporation, which licenses it to more than 200 commercial sound contractors and design firms worldwide.

Modeler works on every-

thing from a 512K to a Mac II, where it runs about five times faster than it does on a Plus because of the Mac II's math coprocessor. For more information, call Bose in Framingham, Massachusetts, at 617/879-7330. —Craig O'Donnell

Big Screens, New Choices

Five new entries into the black-and-white large-screen market bring Mac enthusiasts new capabilities.

Perhaps the most dramatic of these new offerings also has the smallest screen: 17 inches, versus 19 inches for the other four. But what E-Machines' The Big Picture IQ lacks in size, it makes up in image quality by bringing the Mac II 256 levels of gray, compared with the one level of gray displayed on a Macintosh Plus or SE. High-quality photographs can now be scanned, displayed on the screen, modified electronically, and then pasted into page

(continues)

Quick. Pick the workstation.

It's the Macintosh™ II with the big, high-resolution, high-performance 19" display.

Available only from SuperMac Technology.

Graphics *power* that turns a great *computer* into a great *workstation*. The result: The ultimate system for running Mac software. Because it is, simply, the ultimate Mac.

How to create the Macintosh workstation:

Just install one of our workstation video boards in any Mac II slot.

Then connect your monitor. Turn on the power, and you're *running*. No special software. No jumpers.

For color, our *Spectrum*™ system brings you 1024 x 768 resolution with up to 256 glorious colors at once, from a palette of over 16 million. Or 8-bit gray scale, if you wish.

For monochrome, you get even greater resolution of up to 1365 x 1024 pixels with our low-cost *Graphix*™

Spectrum offers double the visual area of Apple's color display. So you see much, much more of your work.

system. That means that Macintosh can display a two-page spread with room to spare. *And* you can still read the fine print!

Because SuperMac video boards are programmable, you can even start small and upgrade later. Choose from Apple's 640 x 480 monitor, or choose an 800 x 600 multisync-type monitor for 50% more resolution. Or for the ultimate workstation, choose SuperMac's 1024 x 768 19" workstation monitor.

See SuperMac video before you commit to *any* video for your Macintosh II.

Only SuperMac video gives you highest resolution.

Only SuperMac video gives you your choice of monitors, up to 19 inches.

Only SuperMac video runs all the standard Macintosh software *and* A/UX, Apple's implementation of the UNIX operating system.

(And for specialized broadcast applications, we've even included genlockable NTSC output.)

See SuperMac video at your nearest SuperMac video dealer. And see the difference between a great computer and a great *workstation*.

SUPERMAC
TECHNOLOGY

295 N. Bernardo, Mountain View, CA 94043, (415) 964-8884

makeup applications for magazine-quality results. The Big Picture IQ lists for \$2895 and offers 1024-by-808-pixel resolution.

Although the LaserView from Sigma Designs offers only four levels of gray, with 1664-by-1200 resolution, it's capable of emulating workstation performance—resulting in 11 times the number of pixels displayed on a Mac SE screen. The LaserView lists for \$2395 for the Mac II and \$2295 for the SE.

Another ultra-high-resolution display is the Vista 1600 from Cornerstone Technology, which features 1600-by-1280 resolution and costs \$2195. Also listing for \$2195 is the Viking 1 by Monitorm, which is plug compatible with the Mac II and the SE (and with IBM's PC, XT, and AT) and features 1280-by-960 resolution.

Looking a lot like the Vista 1600 is Radius's \$2395 Two Page Display (TPD). But don't be fooled, Radius only borrowed the bezel around the front edge—the insides are completely different. The TPD offers 1152-by-864 resolution and simultaneous use of the SE's screen—a feature Radius introduced a year ago with its Full Page Display.

The TPD also has a number of unique features built into the hardware: tear-off menus for all programs, a magnifier, an enlarged menu bar, and the ability to bridge the two screens so the cursor flows from the TPD to the Mac screen without interruption.

For further information, call E-Machines in Tualatin, Oregon, at 503/692-6656; Sigma Designs in Fremont, California, at 415/770-0100; Cornerstone

Technology in San Jose, California, at 408/433-1600; Monitorm in Minnetonka, Minnesota, at 612/935-4151; and Radius in San Jose at 408/434-1010.

The Profits Motive

Button Down Software's *Profits* promises to be a program that will sell Macs to a group previously thought to be thoroughly entrenched in the MS-DOS environment. *Profits* will appeal to stockbrokers and active traders because it offers technical tools that have not previously been available on any personal computer.

Profits instantly creates charts that can be customized in a way that's both innovative and consistent with the Mac interface. It even coins a few new terms in the process; *chart suites* is one. Chart suites preset the program to open as many as six prespecified types of charts at once, or the same type of chart for six different stocks, commodities, mutual

funds, or indexes.

Quotes can be downloaded from Dial/Data or CompuServe directly into specified charts and printed in a number of ways. The charts are enlarged when printed in order to take advantage of paper size; one or more charts can also be printed on a single page.

Profits allows you to set alarms, so that a bullet will automatically be placed on your charts to alert you to whatever activities you specify.

The Mac II brings out the full potential of this program, with its larger screen size and its customizable color environment that can better distinguish between different trend lines on the same chart.

Although the package does include some basic information about technical analysis, it's really designed for the serious trader—if only because of its price. But with a staggering number of customizable charts, as well as the refined trend and momentum indicators available for the first time to personal computer users, the \$495 price could be money well spent for a portfolio manager in need of technical tools. —Linda Joan Kaplan

No, this isn't a chart of Black Monday's stock crash—but it could have been. Serious technical traders predict the future using Profits' charts.

Because John Farago looked ahead, students can now plug into a network easily.

Mac Law School

Five years ago, when John Farago and two others founded the

City University of New York (CUNY) Law School at Queens College to specialize in teaching public interest law, they knew computer access was going to be important to faculty and students alike. So Farago insisted that the campus's one building be wired as if data were a utility—just like electricity—with computer-network-access outlets throughout.

Last summer, the school's computer system was rebuilt from scratch. Now there are 150 Macintoshes, 27 LaserWriters, 70 DEC Rainbows, and 3 DEC MicroVAX II computers ready to accommodate about 450 students and 150 faculty and staff members.

All these computers are attached to the CUNY computer network, an Ethernet backbone connecting 16 AppleTalk networks (configured with Farallon's PhoneNet and accessed with Kinetics' FastPath) to the MicroVAX systems. With Pacer's

QUICKEYS™

The keyboard enhancer for your Macintosh

"QuicKeys is the sort of outstanding product that you recognize instantly as a Mac classic; an essential product for every Mac in your office."
Bob Perez, Business Evangelist, Apple Computer, Inc.

For: Mac 512E, Plus, SE, and II.
QuicKeys gives your extended keyboard something to do. Works with standard keyboards, too. "QuicKeys brings new life to old and new keyboards."
-Neil Shapiro, Editor-At-Large, MacUser, Chief Sysop: MAUG

How fast can you learn to use QuicKeys?
How fast did you read this sentence?

Define up to 100 universal QuicKeys (to use anytime), plus up to 100 QuicKeys for each and every program you use! Just \$99.95

Assign keys for all sorts of commonly used commands: opening programs, repetitive text, selecting typefaces, opening desk accessories and more. Your are unlimited in what QuicKeys can do for you. It's so easy to use, you'll want to use it with everything.

CalendarMaker™

Presentation quality calendars.

"If you use calendars, you need CalendarMaker"
- Nibble Mac, October 1987

"Every year I have the same problem: finding the ideal calendar... In answer to this universal dilemma CE Software has published CalendarMaker." MacWorld, March 1987

4-1/2 Mouse rating. MacUser, December 1986

Enter events manually or import from programs including: MORE!™, SideKick™, BatteryPak™, SmartAlarms™. Export calendars to MacWrite, MacPaint, MacDraw, PageMaker and others.. Just \$49.95

DiskTop™

A portable finder.

"DiskTop may well be the best desk accessory I've ever owned; I use it more than any other...this may be the best value in Macintosh software today."
Max Vizla, The MACazine, November 1987.

4-1/2 Mouse rating-MacUser, August 1987.

With DiskTop you can find, copy, move, rename, create folders, and more without ever leaving the document you're working in.

DiskTop contains the most powerful yet easy to use "Find" command available on the Macintosh. Hard drive users love it. Just \$49.95

CE SOFTWARE

Circle 604 on reader service card

PCLink, students access DEC's E-mail program, *VAXmail*, to send messages to faculty members. They can also transfer files between the Mac and VAX systems.

In addition to accessing the MicroVAX systems, students use the Mac for word processing, desktop publishing, and communications. Each of the 11 section libraries at the school has four Macs used specifically to access Westlaw, a law database.

Software programs are available on two of CUNY's *AppleShare* file servers, one of which is a Mac II with an 80MB hard disk. Programs and documentation are also kept in the school's main library for students to check out as necessary. In the study areas—student cubicles and even the main library desks—network connections are plentiful so that students can bring in their own computers to connect to the school's network.—Brita Meng

The Complete HyperCard Handbook

Some software programs have all the luck. For instance, on the day *HyperCard* was released, an equally groundbreaking guide book was made available. While Bill Atkinson and friends were inventing *HyperCard*, Danny Goodman was right there, trying out the results and writing them up in *The Complete HyperCard Handbook*. The purpose of this collaboration was to demystify a complex and hard-to-describe program.

HyperCard's dual nature makes the task of composing a worthwhile handbook even more challenging. On its face, *HyperCard* provides a versatile

method of constructing a database you can easily navigate using visual cues. Under *HyperCard*'s surface is a language called HyperTalk, which Atkinson cowrote with Dan Winkler. HyperTalk is an almost conver-

sational programming language that makes creating Macintosh programs possible for all of us. *HyperCard*, in effect, allows you to fiddle under the hood of the elegant Macintosh interface.

The Complete HyperCard Handbook serves both powerful functions admirably. It's a tome of 700 pages, fluff-free and exhaustive. It treats such subjects as the mechanics of making cards and assembling them into *stackware*; creating links; and writing instructions in HyperTalk.

Goodman's book also provides in-depth coverage of another *HyperCard* surprise: a multifunctioned paint program. Even if you don't normally use paint programs, you'll find yourself creating graphics in *HyperCard* regularly.

Although *The Complete HyperCard Handbook* was not meant to be a reference book per se, it can be used as one. I was involved in a small group whose task was to convert the entire *Whole Earth Catalog* into many thousands of *HyperCards*. We were able to pick up a number of tips from the *Handbook*.

HyperCard, with its tools-for-making-tools structure, is simply one Macintosh program that you won't be able to exploit fully without supplemental help. For the immediate future, this is the book to get.

—Kevin Kelly

MacCray or CrayMac?

According to Brand Fortner, special programs coordinator at the University of Illinois's National Center for Supercomputing Applications (NCSA), the center is "bringing supercomputer power to the masses." Well, at least to those owning a Mac and some communications software. That's all it takes to plug into the center's new Cray X-MP/48 for a connection that puts the Mac at the forefront of computerized scientific research.

Here's how the Mac-Cray interface works: when you log on, the Cray appears as a win-

er programs. Supercomputing results have never been so easy or convenient.

The Cray's present operating protocol will be replaced by the Cray Finder, a simpler, icon-based environment like the Mac's. In addition, users will have access to the NCSA's new image-processing program *Imagetool*, which anticipates the move from numbers (bytes) to images (megabytes) as the basic unit of computerized scientific data—a move that's necessary because of the almost incomprehensible volume of numbers yielded these days by scientific research.

Astrophysicist Mike Norman developed *Imagetool* to interpret his unmanageably complex data about extragalactic

A shock wave from an exploding supernova moves down through intergalactic clouds, changing their shapes and possibly causing the formation of new stars, new galaxies, and new worlds.

dow (or windows) in Multi-Finder. Instead of an application program, however, each window leads you into a session on the Cray. You can prepare processing jobs on the Mac, send them via NCSA Telnet to the Cray for processing, get the results up to 100,000 times faster than with a Mac, and then cut and paste the data into oth-

jets. The program translates that data, which would otherwise take a bewildering matrix of graphs to represent, into graphic simulations in motion.

Imagetool, along with the Cray Finder, should be part of the Mac-Cray interface in just a month or two. Even at its present stage, however, the interface is like starting up a Volkswagen and finding yourself flying a jet.—David Dobbs

Circle 373 on reader service card

Some may call it electronic slide storage. But the ability to paste 16.8 million colors into a page layout has major implications.

Great Color, Lots of Storage

Every once in a while, technologies come together and wonderful things happen. This time, they're happening to color on the Macintosh.

Color began on the Mac II with Apple's video card, which displays up to 256 colors on the screen—very impressive. Then, as soon as Apple began ramping up production of the II, we heard about video cards offering up to 16.8 million colors. The result was photographic-quality images suitable for many demanding applications.

Think of the potential market: all those magazines, catalogs, advertisements, newsletters, brochures, annual reports...even newspapers. They could use more color at reduced cost if they could computerize the processing and pasteup of color images.

But because each color image can require 1- to 4MB of memory, lots of mass storage was needed. Now, that storage technology is coming to the Mac in the form of optical memory called WORM (write once, read many), which can hold 50 gigabytes of informa-

tion in a changer that holds 50 WORM disks.

MicroDynamics is putting it all together using a 24-bit color video card from Raster Ops. Here's how it works. A color slide is scanned, and the electronic image is displayed on a Mac II using the video board. The image is then stored on the WORM drive. Later, the image is recalled to the screen, processed, cropped, and pasted into a page layout. Other software will create the color separations, and the resulting negatives will be ready for the pressroom. For further information, call MicroDynamics in Silver Springs, Maryland, at 301/589-6300 or Raster Ops in Cupertino, California, at 408/446-4090.

This Little dBase Went to Market

Finally, after being announced over a year ago, Ashton-Tate's *dBase Mac* is on dealer shelves. The program supports color on the Mac II and utilizes files directly from other *dBase* applications—important because the

dBase family makes up over 60 percent of the United States retail database market, according to Ashton-Tate.

Much of *dBase*'s success can be credited to the hundreds of developers who have written custom applications since *dBase II* was introduced for CP/M computers in 1982. These developers haven't been forgotten in *dBase Mac*, which includes a "protect" mode to keep users from altering the custom-written code. A runtime version of *dBase Mac* is being prepared so applications can be utilized by a developer's clients without their having to buy the more expensive *dBase Mac*.

Using *dBase Mac*, you can export and import data to and from *Microsoft Excel*, *Microsoft File, 1-2-3*, *Omnis 3 Plus*, *Double Helix*, and *Framework*, all via ASCII text files.

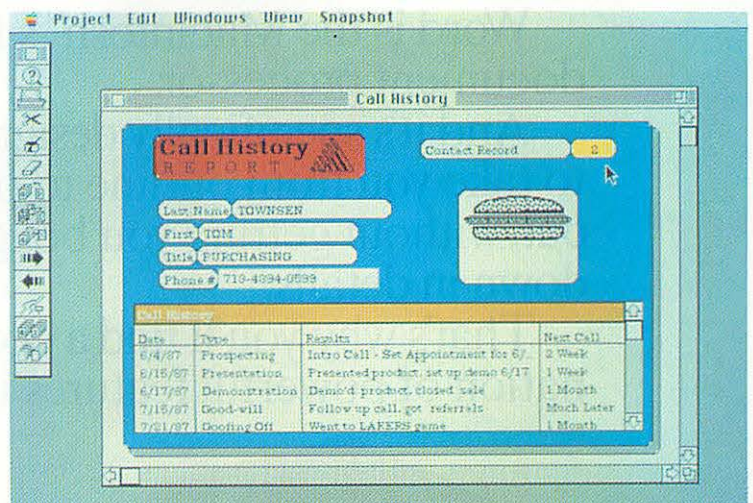

Former versions of *dBase* required learning a high-level programming language. But through use of the Macintosh graphics interface and extensive pop-up menus and dialog boxes, *dBase Mac* performs many database functions without requiring programming. That doesn't mean a manual won't be needed—as with any

complicated program, there's much to explain. If needed, the programming language is available for direct database manipulation.

Ashton-Tate maintains that while all other Macintosh databases provide only one-way relationships between data, *dBase Mac* is a truly relational database because it establishes two-way relations between various fields. Other features offered by *dBase Mac* include a virtually unlimited number of files and reports with custom formatting and graphics.

The \$495 price of *dBase Mac* positions it squarely against Odesta's *Double Helix* and Blyth's *Omnis 3 Plus*. Higher up the price ladder is Acius's *4th Dimension*, which lists for \$695 and offers multiuser functionality for networked applications.

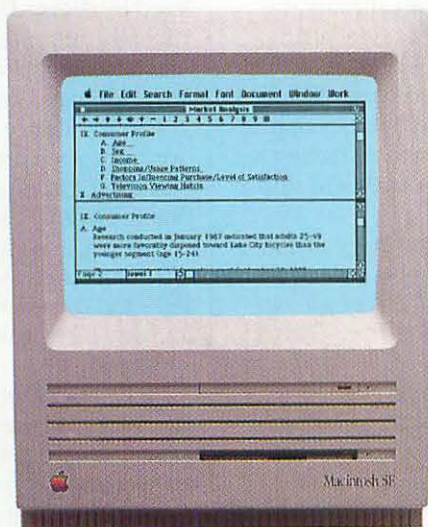

Early purchasers of *dBase Mac* reported they were unable to get the application templates manual and disk promised on the warranty registration card. Ashton-Tate told *Macworld* that it was indeed unable to supply the manual and disk until some two months after shipping the program. For more information, call Ashton-Tate in Torrance, California, at 213/329-8000. □

dBase Mac features an advanced relational database. Its reports, designed using drawing tools, can include photos, drawings, and bit-mapped images for a customized look.

Hurry up and

Whether it's a two-page letter or a 100-page report, the whole point of writing is to get to the point. And nothing gets you there faster than Microsoft® Word, Version 3.

Moving an outline heading moves its associated text. So you can not only organize your thoughts, you can quickly rearrange your words, too.

That's because Word is not your ordinary word processor. In fact, it's not a word processor at all.

Word is the Macintosh™'s first document processor.

And it's specifically designed to take you from outline to output, without getting you bogged down in details.

That's why you'll find a combination of powerful features in

Word you won't find anywhere else.

Like an integrated outliner for organizing your thoughts. And for rearranging pages of paragraphs with a simple click of the mouse.

Likewise, a simple mouse click is all you need to check and correct your spelling, using Word's built-in, customizable 80,000-word dictionary.

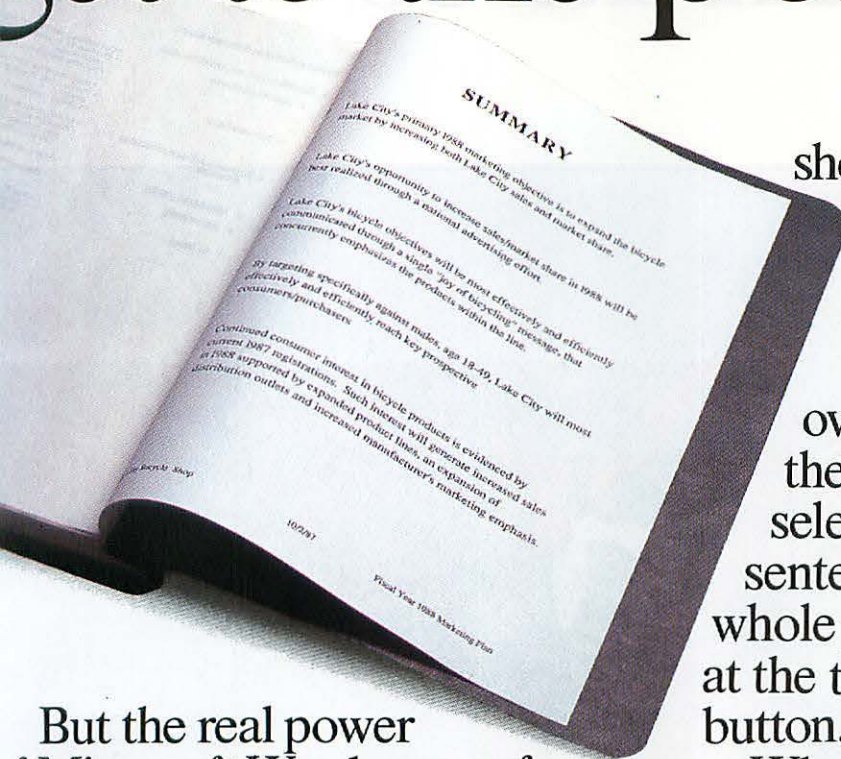

Plus you can preview and adjust page layouts before you print. Customize menus, so the files, fonts and formats you need are always at hand. Even assign Word the time-consuming chore of generating a complete index and table of contents.

All critical, professional features that strip hours off the task of turning rough thoughts into crisp, persuasive documents.

For more speed, Word lets you duplicate all mouse functions from the keyboard.

get to the point.

But the real power of Microsoft Word comes from the major time-saving features available while you input, edit and format your work.

Advanced features, like command and accelerator keys, that

highest concentration of owners in a single age group with 12.7 percent. The combined age group of 25-44 accounted for the greatest concentration of total bicycle sales with 55.4 percent.

Relative to population in each age group, sales indicate that there is above average interest in bicycle products in the 15-44 age categories. Sales are relatively lower, at 27.6 percent, for the younger segment (age 15-24); this is significant given the fact that the population in this segment is almost half that of the 25-49 segment.

The discrepancy between the information from Lake City's warranty registrations and the current research finds may be due to the following:

care that the 20-24 age group had the highest concentration of own a single age group with 12.7 percent. The combined age group of 25-44 accounted for the greatest concentration of total bicycle sales with 55.4 percent.

Relative to population in each age group, sales indicate that there is above average interest in bicycle products in the 15-44 age categories. Sales are relatively lower, at 27.6 percent, for the younger segment (age 15-24); this is significant given the fact that the population in this segment is almost half that of the 25-49 segment.

The discrepancy between the information from Lake City's warranty registrations and the current research finds may be due to the following:

- Lake City's warranty information may not reflect accurate information regarding the purchaser.
- The owner/buyer may not be the primary user of the vehicle.
- The mail survey technique used for the current research may have been biased toward older respondents.

With style sheets, you can change from one format to another with just a click of the mouse.

duplicate every mouse function while you keep your hands on the keyboard. Glossaries, for recalling frequently used text with a few rapid keystrokes. Style

sheets, for saving and reusing type styles and formats with a simple point and click.

And obvious, but often overlooked time-savers, like the ability to select words, sentences or whole paragraphs at the touch of a button.

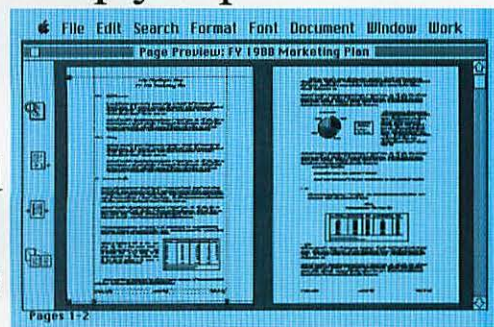

What can Word do for you? The answer can be found at your local Microsoft dealer. For the address of one near you call (800) 541-1261, Dept. B65. Ask him to help you put Word

to work in preparing your most complicated documents.

And in no time at all you'll reach your own conclusions.

What's the difference between Word's built-in spelling corrector and a secretary with a dictionary? How about a couple of hours.

Page preview saves you endless trips to the printer because you can revise page breaks and margins before you print.

Network Tales

Trials and tribulations of a network traveler

MAX SEABAUGH

by David Ushijima

Networks, we have been told, are the wave of the future. Sun touts the network as *the* machine, and Apple's John Sculley predicts a shift to networks as the epicenter of computing power. The problem, though, is that networks aren't as easy to get running as they are to sell.

At *Macworld*, we live on a network. From the moment our editors walk in each morning until our disk drives spin down for an evening landing, we meet in the electronic aisles that make up *Macworld*'s AppleTalk link.

Twenty-three people currently inhabit our networked office, including our East Coast Editor 3000 miles away in Boston (see "Who's on the Net"). More than half of these people are heavy network users, generating a steady flow of network mail, corresponding over the network modem, and constantly transferring articles to the file server or spooling them to the LaserWriter. We even find time for an occasional session of *Maze Wars*+

Although it has taken a while, most of the staff now use the network as freely and as often as they do the telephone. However, getting to this point wasn't easy. Our net construction was filled with twists and turns, the troublesome stuff nobody mentions. Nothing was as simple as the manufacturers would have us believe.

Mail in a Box

After LaserWriter printing, network mail is the service we use most often. In our office, dropping a memo on the seat of an editor's chair gets a quicker response than putting it in the in-box on his or her desk. Surprisingly, the network mail box now ranks on a par with the chair seat for most people. Editors have been known to respond to an electronic memo even before sitting down.

In the year we've had *InterMail* running on a Mac Plus with an AST-4000 hard disk, the program has rarely crashed and has never permanently lost data—a testa-

ment to *InterMail*'s design and the AST-4000's durability. In fact the only major problem I've had with *InterMail* was when I plugged my Mac II into the net. So anxious was I to see the dazzling graphics that I completely forgot to check whether the II would run on the network. The problem was, it didn't. In trying to send mail, I discovered the Mac II would sporadically crash as soon as I pulled down the *InterMail* desk accessory.

A quick phone call to Interactive Network Technologies in Massachusetts uncovered the problem. We were running version 1.0 of the *InterMail* software; with the Mac II we would have to upgrade to version 1.35. The InterNet folks were kind enough to rush out an update disk, but nevertheless it was another two days before I could open my mailbox.

Network Tip: New machines invariably require new versions of network software. Before adding Mac SEs or Mac IIs to your network, find out from the manufacturers if new versions of network software are required.

Creaks in the Night

A network is one of those things you never think about until it starts misbehaving. In fact, when it's working smoothly the network is as invisible as it is silent. Our trouble began with a creak.

After running *AppleShare* 1.0 for nine months, the 80MB hard disk on which it ran started rattling. Cars warn owners of impending disaster in the same way, so it was no surprise when the rattle developed into a loud clatter. As you might have guessed, the disk crashed, bringing file service to a halt on the network. It's bad enough when a personal disk drive falters, but when the network file server quits, inconveniences—and the blood pressure of our network manager—multiply, in our case by 23.

Avoiding Network Grief

The answers to the most aggravating network problems can usually be traced to the simplest things. Here's a list of practical tips that will make your day on AppleTalk run a little more smoothly.

- Install Kensington Micro-ware's connector clips on all AppleTalk connectors. You'd be surprised how often a problem is due to a loose connection. We've wasted days tracking down the strangest problems, only to find a loose AppleTalk connector.

- Remember to select both a service and a device using the Chooser. Choose the network service icon from the left side of the window, then choose the appropriate device from the scrollable list.

- Verify your user name in the Chooser. If you recently

copied a System file from someone else, be sure to enter your own user name in the Chooser. By leaving the previous user's name in the name field, you may prevent that user from logging on to a network service.

- Check the Caps Lock toggle key. If you've been having problems logging on to a program that's protected by a case-sensitive password, be sure the Caps Lock key is up.

- Pick a consistent user name for all your network applications. For example, if I register myself as "Eileen Drapiza" in an application like *InterMail*, I should not register myself as "Drapiza, Eileen" or as "E. Drapiza" in *AppleShare*. The Mac uses the name you enter in the Chooser to log on to each network service. Consistency makes a big difference.

- Make sure you are running the most current version of the system files. Using different combinations of the System and Finder on one network can wreak havoc. Check with the network administrator for the latest System, Finder, and LaserWriter files. If you must boot from a disk containing an old System file, disable AppleTalk on your workstation (from the Chooser).

- Make sure you've plugged the AppleTalk connector into the printer port. It's easy to mistake the modem and the printer port. If you pick the wrong one, you'll receive a message saying "Your document can't be printed. Make sure AppleTalk is installed and a printer chosen."

—Eileen Drapiza

Our first thought was to restore the file server from the image file we had saved on tape. But as luck or Murphy's Law would have it, no matter what we tried, we couldn't coax the MagNet 85X's built-in tape drive to read the tape. Coincidentally, Eileen, our network manager, had just received *AppleShare* version 1.1. After reading through a list of bug fixes, and living through numerous *AppleShare* crashes, we decided to upgrade.

We ended up reinitializing the hard disk and installing *AppleShare* version 1.1 from scratch. Fortunately we all had backed up our own data from the file server, prompted by flashbacks of the last disk crash.

Network Tip: If possible, test drive a hard-disk file server on a network before you buy it. Try backing up the server and restoring its contents from tape.

Check with the manufacturer if you want to back up an *AppleShare* volume file by file. Several companies offer updates to their backup software that will let you do this. Attempting to restore from a file-by-file backup, however, usually means you lose the access privileges and ownership information from all folders and documents. If you run without a network backup device, remind users that they must back up their own files regularly.

New Life for Fractured Ears

Even though upgrading to *AppleShare* 1.1 had done wonders for our faith in file servers, we (or more specifically Mark, who had to work with the clatter of the file server in the background) still had to contend with the rattle of the disk drive.

Eventually we decided to replace the MagNet 85X with NuData's GigaCell, a 300MB disk and tape drive designed from the start for reliability and heavy network use. The GigaCell is a product that looks and sounds the part of a high-quality ma-

chine. But even though the GigaCell is the type of product that instills confidence, it was not without its share of problems.

Having made the decision to swap drives, we daisy-chained the GigaCell to the MagNet 85X, hoping to copy all our files. No luck. Both drives contained SCSI terminators, neither of which were accessible from outside the case. Despite proving her dexterity with needle-nose pliers, and after logging enough hours to launch a second career as a technician, our network manager could not successfully chain the drives. We finally resigned ourselves to re-installing the file server software from scratch.

Although we were now able to run *AppleShare* from the GigaCell, we still had a problem. The drive contained 300MB of storage, but we could only access 150MB of it. Eric Herzog of NuData explained that our drive actually contained two 150MB drives driven by a single SCSI controller board. The current version of *AppleShare*

software, however, only recognizes one drive per controller. The plot thickened. The solution was for us to upgrade to a single 300MB drive, which NuData agreed to install. The 300MB drive would in turn require a ROM change in the drive's SCSI controller, so that we could start up from the hard disk rather than from a floppy—and the ROM upgrade was not yet available from CDC. Finally, we decided to run *AppleShare* on two 150MB DataCell drives.

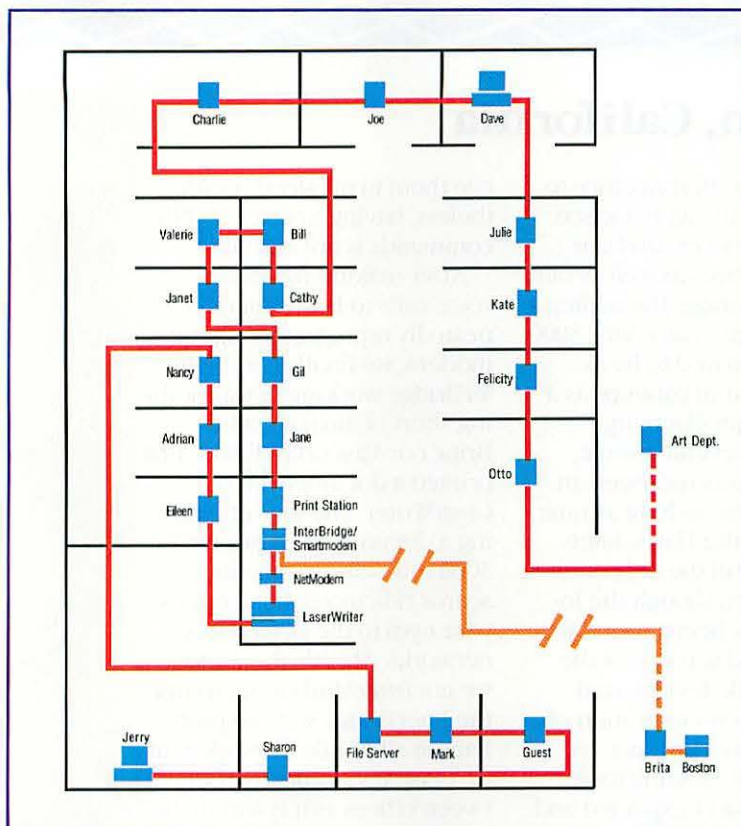

Network Tip: When shopping for a hard disk to use as a file server, look for one designed with reliability and durability in mind. Pay attention to overall construction quality. The mean-time-between-failures figures for a drive often reflect how long a drive will last. Remember that on a network, the drive will be running continuously and will most likely get a heavier workout than a personal disk drive. If you plan to chain drives to the server, find out how easily you can remove the SCSI terminators and change the SCSI address.

My Memo, Your Paper

Everyone prints on the LaserWriter and no one likes waiting. So our decision to install *LaserShare*, Apple's LaserWriter spooler, was a popular one—at first. Although *AppleShare* 1.1 ties up one Mac as the file server, it lets you run a foreground program like *LaserShare* in return. For me this was great, because I had been running Think Technologies' *LaserSpeed* spooler on my Mac Plus. When I switched over to the Mac II, however, the version of *LaserSpeed* I had (1.0) would continually crash. *LaserShare* cured my spooler withdrawal.

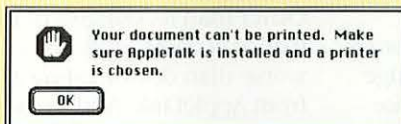

Within an hour after our network manager installed *LaserShare*, a rather heated discussion developed around the printer. Previously, anyone could select Manual Feed from the Print dialog box, start printing, and then race over to the printer and insert letterhead in the feeder. Now if you tried that you might get a letterhead version of someone else's report. Once we discovered (and turned on) *LaserShare*'s Bypass option, users could print directly to the LaserWriter, and things returned to normal.

Network Tip: Allow users to select or bypass network services. Don't assume everyone will do things the same way on the network. Allow for as many variations as possible. One of *AppleShare*'s strengths is that it lets people do things in a variety of ways without dictating how they should use the network.

Who's on the Net
Our network connects the Macworld editors in San Francisco, the art department, and an editor in Boston. Keeping 23 Macs, a LaserWriter Plus, a NetModem, an InterBridge, and an AppleShare file server running smoothly has been no easy job for our network administrator.

Network Messages We Have Known

If you accidentally plug the AppleTalk connector into the modem port, you'll get this error message when you try printing.

If you see this one while you're online, it's time to move the NetModem out of reach.

Shortly after installing the InterBridge, our file server crashed. This is the message we got after rebooting the file server.

A PostScript error has been generated by the LaserWriter driver; the document is OK but cannot be printed.

It took us a day, but we traced this problem to a loose AppleTalk connector. The LaserWriter would appear and disappear from the Chooser's device list. Because we were using custom AppleTalk cabling, the cable was unterminated.

Printing "Untitled1"
To cancel, hold down the ⌘ key and type a period (.).

Boston, California

By linking the Boston office to our network in San Francisco, we were able to expand our network services as well as our editorial coverage. But adding a remote bridge to an editor 3000 miles away proved to be as much a lesson in patience as a boon to our productivity.

Although several remote bridge products had been announced, some as long as nine months ago, the Hayes InterBridge was still the only one shipping. Even though the InterBridge has been around for two years and was one of the first AppleTalk devices available, that was no indication of its maturity as a product. In fact, getting it running took more time than I expected and uncovered a few problems.

To start with, most modems advertise themselves as Hayes-compatible, meaning that they implement a majority of the same commands found in Hayes modems. When it comes to connecting the InterBridge to a modem, you should take Hayes-compatibility seriously. I spent the better part of a day trying to get two Novation Professional 2400-baud modems working with the InterBridge—to no avail. When I finally tried two Hayes Smartmodem-2400s, things went much more smoothly.

That's not to say that from then on installation was a breeze. While most of the set-up procedures are straightforward, the most annoying part is having to program the modem by typing a series of cryptic commands. After typing these commands a few times, I got familiar enough with them to re-

cite them in my sleep—nevertheless, having to enter cryptic commands is not Mac-like.

After making numerous voice calls to Boston and repeatedly reprogramming the modem, we finally got the InterBridge working. It was nothing short of amazing when Brita, our East Coast Editor, first printed a document on our LaserWriter. The idea of sending a document to a printer 3000 miles away somehow seems ridiculous, but it opens your eyes to the potential of networks. Shortly thereafter, we got *InterMail* running over the InterBridge with no problems at all. While network mail isn't fast, it's as effective between offices as it is within the office. And even though Hayes doesn't recommend running a file server over a remote bridge, we had no trouble getting *AppleShare* 1.1 running. Other than its sluggish performance at 2400 baud, it's no worse than downloading a file from *AppleLink*. And from my initial estimates, it's still cheaper—AT&T's daytime long-distance rates to Boston are about \$18 per hour versus \$25 per hour for *AppleLink*.

While the InterBridge hasn't solved all our communications problems, it sure beats fighting time zones and unreturned phone calls. And although InterBridge's price, \$799, inhibits its usefulness as a remote bridge for single Macs, it's a very effective way for two remote networks to communicate. Even at \$799, having the remote mail service is by itself worth the price of admission.

The Network Switchboard

Although we now had communications working within our office, we still needed a way to connect our network with the outside world. The solution arrived in the form of a product I had seen demonstrated a few weeks before. Shiva, a company based in Cambridge, Massachusetts, had announced a modem that actually connected to a network rather than to a single Mac. Otto, who downloads our *AppleLink*, MCI, and CompuServe mail daily, understandably couldn't wait to see it. Not surprisingly, we installed the NetModem the day after it arrived.

Somehow it's rather amazing to hear the familiar, albeit scratchy, sounds of a dialing modem emanating from the Mac. The NetModem is one of the most useful network devices I have seen yet. On the other hand, seeing the NetModem in action on the network points out the hazards of sharing devices. For instance, no sooner had Adrian installed the NetModem and successfully dialed up *AppleLink*, than Joe, who also wanted to go online, got a dialog box suggesting that he turn the modem off and back on. After Joe dashed out to see what was wrong, and obediently turned the modem off, Adrian, who had gotten cut off in the midst of downloading a file, got a polite message telling him to try reconnecting.

Network Tip: Shutting off a shared device is sure to result in network chaos.

The Homogenized Networker

In many ways networks are averse to change. Add a new piece of hardware or install new software and the network crashes. Ironically, while the Mac encourages users to experiment with new software, Mac networks demand some degree of conformity. When you plug into a network, you lose the freedom to run whatever system software you please.

Prior to upgrading our file server software and mail software, the network had been increasingly plagued by crashes. Even after installing *AppleShare* 1.1 and upgrading to *InterMail* 1.35, many of us were intermittently finding the dreaded bomb on our screens. After adding NetModem, we knew it was time to make sure everyone was running the same version of the system software.

When it comes to running unreleased software, our editors are the worst offenders. They continually evaluate new versions of released, soon-to-be-released, and even some never-to-be-released applications,

stressing the network to its limit. We push the network and in return we endure our fair share of bombs.

Once we had several network services running, everyone had various versions of the network, not to mention the system software. Our net manager immediately sent out a memo urging everyone to upgrade. The problem was that those who weren't using *InterMail* never got the memo. Because they never received the memo, they never upgraded—it was the network version of the chicken and the egg. After posting a printed notice of the most recent system and network software on our (nonelectronic) bulletin board, our network manager embarked on a tireless crusade against nonconforming software. Shortly thereafter the daily stream of network complaints rapidly dwindled.

Even our most troublesome network holdout was cured after ridding his hard disk of extraneous copies of the *InterMail* server software and upgrading the System and the Finder. It was a sign that we were on the road to network recovery.

Network Tip: No Mac is alone on a network. Everyone must run compatible versions of the System, the Finder, and the software for any network services. Users who want to run unreleased software should alert the network manager or wait till after hours before bringing the network to its knees.

Well Worth the Wait

It's not all roses in our network garden. We still have our share of problems. And I expect we'll prick our fingers on a thorn or two as we add and evaluate new network products.

Despite the problems we've had, we're still hooked on the network. It's by far the fastest way to connect people and their work. Some days, I send memos on the fly and respond to the network mail almost as fast as it comes in. Whereas a paper memo could languish on my desk for hours or even days, the jingle that accompanies an *InterMail* memo always gets my attention. And besides, sometimes it's as fun to wander through gateways or browse the HyperCard stacks on our file server as it is to dodge an opponent in the maze. Excuse me—a message has just arrived.

See *Where to Buy* for product details.

Rush Hour

Farallon Computing's Traffic Watch is essential for monitoring network traffic. In addition to reporting on the total number of packets sent (top), this program helps network managers

identify traffic patterns and select locations for setting up bridges that will improve a network's performance.

Shades of Gray

*The contrast
between previous
scanners and
the new gray-scale
machines is
as clear as black
and white*

by Jim Morton

Last July *Macworld* published a comparative review of popular scanners available for the Macintosh ("Scanning the Horizon"). The article's conclusion surprised some people: after asking himself which scanner was the one to buy, the author answered that maybe it would be better to wait. It was sound advice. Besides having trouble with software and standards, the scanners we looked at last year (though higher in resolution than the original Mac scanners) could reproduce photographs and other continuous-tone images with only limited success.

Now a new generation of scanners is emerging that will finally make possible the desktop publisher's dream of producing publications that can simply be sent to a phototypesetter with every photograph and piece of art in place. Because these new *gray-scale* or *gray-level* scanners can take advantage of high-resolution output devices like the Linotronic 100 or 300, they can produce halftones that are nearly indistinguishable from those made by conventional graphics cameras. And you can manipulate the gray-scale files these new machines produce in ways previously impossible, changing tonal values or sizing images without rescanning.

With these new capabilities, however, come new complexities. In computer stores around the country right now, anyone looking for scanners is liable to hear that a particular model "saves 8 bits per pixel for a total of 256 gray levels at 300 lines per inch, supports TIFF and EPSF, and offers built-in gamma correction and a user-definable dither matrix."

Sounds good, but what does it mean? To choose the right scanner today—and to get the results you want from it—you'll find it helpful to understand a few things about halftones generally, about the basic principles of halftoning with a computer, and about how the new gray-scale scanners differ from the previous *bi-level* machines. Even if you use an old scanner, having a grasp of how your machine works will give you more control over your output.

Halftoning

Black-and-white photographs contain hundreds of gray tones. Because printing presses generally print these images with only one color (black), printers must use a process known as halftoning to reproduce a full range of grays. Halftones, which printers make by reshooting continuous-tone art through special screens, are composed of variously sized dots that simulate gray values. Although dots in a given picture are of different sizes, their frequency is constant; this frequency is known as a halftone's *screen ruling* and is measured in lines per inch (lpi).

Newspapers commonly use halftones with a screen ruling of 85, which means newspaper photos contain 85 lines, or rows, of dots per inch. A 100-line screen is typical of good-quality newsletters or low-

Connecting the Dots

The number of printer dots in the dither matrix defines the halftone dot's resolution (and the number of gray levels possible). The matrix style affects the image's appearance. These three patterns all represent 50 percent dots. The left-most is a spiral pattern, the next is a star. The 8×8 matrix forms the truest dot.

budget books. Quality books and magazines (like this one) commonly use 133- to 150-line screens.

Halftones are generally produced in one of two ways. The inexpensive way is the *photomechanical transfer*, or PMT, which is printed on paper and simply pasted up along with the text on printing flats. The practical resolution limit for this technique is 100 lpi; any finer and the dots bleed together or disappear when your printer makes printing negatives from your flats. A more expensive technique skips the pasteup step and goes directly to negatives. This method produces up to a 150-line screen, though not all print shops can handle that fine a screen.

In the world of traditional, analog halftones, resolution—expressed as screen ruling—is the main index of image quality. One reason there's currently so much confusion about scanning is that in the digital world, image quality is the result of an equation with two main variables: knowing the resolution of a scanner isn't enough, you also have to know how many gray levels it produces.

The main concept to remember in Mac scanning is that as the number of gray levels goes up, resolution goes down, and vice versa; achieving the best results is always a matter of finding the optimum mix of both. For example, a 300-dots-per-inch (dpi) bi-level scanner could produce a halftone with a resolution of 150

lpi—but the image will look very crude because it will contain a maximum of 5 tonal values, including black and white. The same machine can produce an image with 26 different tones, but the resolution will be only 60 lpi. This trade-off is a result of the manner in which computers produce the different-size dots that make up a halftone.

Dithering Around

Unlike photographic processes, which produce halftone dots in a virtually infinite number of sizes, printers like the LaserWriter or the Linotronic machines always print the same size dots. This means the dots you see in a Mac halftone are actually clusters of much smaller dots. (Since there seem to be no standard terms, for the purpose of this article the larger, visible dots will be *halftone dots*, and the smaller, 300- to 2540-dpi dots will be *printer dots*.)

If you use a 300-dpi printer to create a 60-line halftone, your scanner software divides the images into halftone dots that are 5×5 (5 across by 5 down) printer dots in size ($300 \text{ dpi} \div 60 \text{ lpi} = 5$). Given this 25-printer dot *dither matrix* (see "Connecting the Dots"), you can make halftone dots of only 25 different sizes. This is why, if you include white (no dot), you get 26 tonal values at 60 lpi on a LaserWriter.

The larger the dither matrix, the more dot sizes the printer can make and the more tonal values it can represent. On the other hand, a larger dither matrix means larger halftone dots—and lower resolution.

The process of creating specific screen percentages using several printer dots to form each halftone dot is called *dithering*. Turning on 50 percent of the dots in a dither matrix produces a 50 percent gray value. The order in which the software turns on printer dots on the way from white to black is also important. Different algorithms for figuring out which dots should be black for a given percentage produce different patterns and effects.

Of course, the way around the problem of trading resolution for gray levels is to use smaller dots. At the Linotronic 100's 1270 dpi, an 8×8 matrix (which produces 64 gray levels, the minimum for a reasonably natural look) takes up only $\frac{1}{50}$ inch, providing a 150-lpi halftone. This is where one of the main advantages of gray-scale scanners comes in. When bi-level scanners digitize a photograph, they save the image as a *MacPaint*-like bit map. The scanning software establishes the dither matrix and assigns which printer dots

Truvel's unique 8-bit TZ-3 is essentially a flatbed scanner turned upside down. Lights and a lens move above the copy stand, scanning books or flat media.

Abaton offers a gray-scale scanner only in this 4-bit flatbed design.

will be on or off. Sending a bi-level file to a Linotronic typesetter won't improve its resolution; in fact, since neither 2540 nor 1270 can be evenly divided by 300 (the sampling rate of high-resolution bit-map scanners), sending a bi-level file to a phototypesetter may result in distortion and an ugly crosshatched pattern.

On the other hand, gray-scale scanners are to bi-level scanners as *Illustrator* is to *MacPaint*. Gray-scale scanners are *device independent*, which means they leave the decision of exactly which printer dots will be on or off up to the printer—which also means these scanners can take advantage of higher-resolution devices to make better-looking halftones.

Into the Gray Area

If you look at the illustration in "Bit Maps in Depth," you'll see that gray-scale scanners also produce bit maps, but their bit maps are "deeper." Think of the cells in the illustrations as samples made by a scanner at 300 samples per inch. For each sample a bi-level scanner takes, it registers a binary value: on or off. When the software saves the file, it looks at how many printer dots in a dither matrix should be on or off and then assembles a halftone dot of an appropriate size.

As the illustration shows, the gray-scale scanner registers far more information about each sample. The gray-scale scanner that made the samples in the illustration is an 8-bit scanner, which means that for every sample it can store an 8-place binary number corresponding to one of 256 gray values ($2^8 = 256$). The other common caliber of Mac gray-level scanner is the 4-bit scanner, which has the ability to assign a given sample to one of 16 gray levels ($2^4 = 16$).

When you save a gray-scale file, you set the screen ruling you want for output. The processor in the printer then looks at the saved information and de-

Bit Maps in Depth

You can think of bit maps from a gray-scale device as being "deeper" than bi-level ones. Bi-level scanners register that a sample is either on (black) or off (white). By contrast, the gray-level machines store 8 bits of information for every sample, meaning they can register 256 binary values (2^8). When the gray-scale file is printed, the output device interprets the gray-scale information and approximates the original tones.

cides how many gray levels the printer can deliver, given that screen ruling. Thus an 8-bit file at a 150-line screen printed on a LaserWriter will have 4 gray levels ($[300 \div 150]^2$); printing the same file on a 1270-dpi Linotronic 100 yields 72 possible gray levels ($[1270 \div 150]^2$); while a 2540-dpi Linotronic 300 will give you more than 256 gray levels (the scanner's maximum).

The other great advantage of gray-scale files is that all the information they record per sample gives them the potential to be manipulated (via new image-processing software such as *ImageStudio*) far beyond the capabilities of bi-level bit maps (see *Reviews, Macworld*, December 1987). *ImageStudio* does have the ability to reconstruct a gray-scale file from the infor-

mation in a bi-level scan. However, the results of this process are not as satisfactory as starting with gray-scale information.

To give credit where it's due, gray-scale scanning on the Macintosh is not really new: ThunderScan has always captured gray-level information. You could use this information to perform sophisticated contrast and brightness editing from within ThunderScan's software, but once you printed the file, saved it to disk, or sent it to a page-layout program, the gray-level information was lost and the file looked no better than output from other scanners.

Gamma Correction

A new catch phrase you are apt to hear when purchasing a scanner is *gamma correction*. Gamma correction is like kerning in page-layout programs: a useful feature that we all managed to live without until we learned what it meant.

Although a scanner may save 8-bit gray maps, that doesn't necessarily mean that you will get 256 levels of gray out of it. Part of the problem is that some scanners save gray-scale information on a straight one-to-one basis. In the real world, the amount of information needed to accurately interpret a dark gray area is greater than the amount of information needed to interpret a light gray area. To solve this problem, some scanners save the information on a curve, so that the amount of

data stored at each gray level is skewed toward the dark end of the scale. This is gamma correction.

Cutting Corners

Since gray-scale scanners save 4 to 8 bits of information where bi-level scanners saved only 1, files can grow ridiculously large in no time. A bi-level scan that takes 70K may grow to 4 megabytes when saved as an 8-bit gray map. If you try to print such a file on a Linotronic, you'll wind up mortgaging your home to pay the typesetter (see "At the Service Center").

The situation, however, is not as bad as it sounds. There are ways to decrease file size and still get the desired results. Besides TIFF (Tagged-Image File Format) storage, the single most important feature of a gray-level scanner is the ability to alter the sample rate of the scan. If you are printing a halftone with a 100-line

Video digitizers, such as this 4-bit Pixelogic Pro Viz, don't use a CCD like other Mac scanners. Instead they produce digital images from video signals.

screen, no matter what device you print on, you will get only one halftone dot for every $\frac{1}{100}$ inch. If you scan at 300 dpi, you'll save nine samples for that one dot—a waste. Most nonvideo scanners offer a variety of scanning rates. When printed, the difference in quality between a 100-dpi gray-scale scan and a 300-dpi gray-scale scan is negligible, but the time it takes to print may vary drastically.

Another way to approach this problem is to use *ImageStudio*. Whatever the magnitude of the original file, *ImageStudio* gives you the ability to cut it down to size either by precropping it or by reducing the resolution. A document sampled at 300 dpi that is opened in *ImageStudio* at a 50 percent resolution, and then saved, will have a resolution of 150 dpi.

Most video digitizers do not offer adjustable sample rates because their available image is based on the

size of the video frame, which is constant. To make up for this limitation, video digitizers offer a lot of information in a little space. Comtrex's Imagizer, for instance, creates an 8-bit gray-map file that is only 204K. On the minus side, video images are always the same size. When enlarged past the original scanning parameters, they often look ragged and unacceptable. Figure about a half-page as the practical limit for good results with these machines.

It's Caveat Time Again

Gray-level scanners offer power never before available with personal computers. But that power has a price. And, as with most things, the real price can be hidden by hype. The image-processing that gray-scale scanners make possible is a sophisticated application. To do it properly, you'll want sophisticated gear. The true cost of getting the halftones you want will probably not be limited to the initial scanner price.

For example, once you've made your scan, you need software to do something with it. Final marketing decisions for many of the gray-scale scanners we looked at had not been made when this article went to press. Abaton was shipping its Scan 300/FB, however, and the base price did not include software. To actually operate your machine, you have to buy a program.

Tip: SCSI Compatibility

The Mac can accept up to seven hard disks, scanners, or other machines daisy-chained to the SCSI port, but they all must have different device numbers. Scanner and hard disk manufacturers set each machine to a certain number before they ship. If your Mac won't start up when you install your new

scanner, it may be because the scanner has the same device number as your hard disk.

On some scanners and hard disks, the device number is easily changed with a DIP switch located on the back or inside the machine. On others, changing the device number

requires special jumper wires and a trip to the computer store. Before you buy any SCSI device, find out what is involved in changing its device number. Make sure that the scanner and your hard disk have different numbers or that you can change the numbers yourself.

C

D

E

F

Six Scans

Different treatments of the same photograph: (A) was made with an 8-bit Datacopy scanner and printed on paper at 100 lpi by a Linotronic 300. (B) was produced with a 4-bit Abaton gray-scale machine and output by the same method as (A). Notice the pronounced banding. (C) is a conventional 100-lpi PMT. (D), the pick of the litter, was made from the same Datacopy file as (A) but was printed directly to negative at 150 lpi. This negative took a Lino 300 only 25 minutes to print. Both (E) and (F) are 50-lpi LaserWriter printouts. (E) was made from the same 4-bit file as (B); (F) is a bi-level file made by the New Image MacScan. The bi-level file looks somewhat better because it shows 36 gray levels, as opposed to the gray-scale machine's upper limit of 16 (note that most gray-scale machines offer a bi-level option for optimizing laser printouts).

New Image's MacScan interfaces enable you to use this Canon sheetfed scanner with a Mac. MacScan comes in bi-level and 8-bit models.

And to top it off, although Abaton offers various software options at various prices, none of these programs can open and edit a gray-scale file.

For that purpose, Abaton recommends *ImageStudio*, at a price in the \$500 neighborhood. By virtue of being first, *ImageStudio* seems to have become the de facto standard for image-processing software. There are, however, other programs now entering or about to enter the market that rival *ImageStudio*'s abilities. Whatever scanner you buy, gray-scale editing and image-processing capability is something you'll want. With gray-scale software you can control the contrast of scans in tiny increments, remove blemishes and extraneous objects from pictures, adjust the halftone screen ruling, eliminate wasted file space, achieve interesting effects, and generally have a lot of fun.

For sheer control over digitized images, no program I've seen so far can match Datacopy's MacImage software version 2.0, which the company says it will ship with its \$9000 Model 840 8-bit scanner. This amazing program does not offer *ImageStudio*'s pixel editing tools, but it lets you design your own gamma curves and dither-matrix patterns either by using tools in the program or by importing formula tables from *Microsoft Excel*. Of course at that price, the software

had better be great.

The computer you'll be using may also determine whether, or how far, you want to plunge into the world of gray-scale art. When you open an 8-bit image file containing 256 shades of gray on a Mac Plus, what you see isn't even close to what you get. This can be a big problem when you're trying to edit images or alter the gray map. For the full effect, you'll need a Mac II and an 8-bit video card with an analog monitor—either color or black-and-white.

Since gray-scale scans can take up huge amounts of storage—not to mention the disk space required for image-processing software—don't even think about this stuff unless a hard disk is in your budget. And having enough RAM is equally important. If your scanner scans to disk, you may wind up with a file too big to

Inside a Scanner

The heart of most scanners is the charge-coupled device (CCD), which contains sensors that register light intensity. In this exploded view of a sheetfed scanner, a lens reads the artwork through a slot as the copy passes between rollers. The lens then focuses the light on the CCD.

At the Service Center

Printing out bit-mapped images on a Linotronic phototypesetter has never been fun. A bi-level bit map of a photo might take up to an hour to print, but you can measure the time it takes to print a 6MB, 8-bit gray-mapped image with a calendar. At \$8 an hour plus \$7.50 a sheet for phototypesetting, versus \$7.50 for a photostat, the choice is obvious. The only time it becomes cost-effective to send digitized images to a phototypesetter is when they are combined with text in complete page layouts. Even then, only images with

gray-level information are worth reproducing this way.

The clock starts ticking once you enter the service center and register, so make sure you waste no time getting your files printed. Whenever possible, print a copy on a laser printer first. Check it over thoroughly before sending the file to the typesetter. Images that have been cropped or resized in a page-layout program take longer to print. If a picture needs cropping, do it by saving the selected portion directly from the scanner software, or by

using *ImageStudio*. The same goes for resizing. Ideally, you shouldn't make any alterations to an image once it has been placed in a page-layout document.

The best way to keep service time short is by keeping scanner files as small as possible (see the advice under the heading "Cutting Corners" in the main article). The new scanner technology can save you money, but only if you use it wisely. That means planning your scans before you make them.

call up for editing or printing. You'll want a minimum of 1MB. (*ImageStudio*'s options for reducing the resolution of a scan and opening only part of it can be helpful in this respect.)

Other hidden costs can include cables and SCSI terminators, which don't come with some scanners. Additional cables can add over \$100 to your package. A SCSI terminator is a small extension plug that looks like it should cost \$2.95 but actually costs about \$40.

So, before buying any scanner, ask for a demonstration—if possible on a system that closely matches your own. Ask the salesperson to bring an image up on the screen and make contrast and brightness adjustments to it; this level of editing is an absolute minimum for useful operation. Find out if the software you need to make contrast and brightness changes is included in the price of the scanner. And ask about cables and terminators.

It's all right to be a pest. Next to your computer, a scanner is probably the most expensive device you'll buy. A few hours of caution will save you from regrets later.

The Right Scanner

The right scanner for you depends on what you'll be doing and how much you want to spend. A scanner that saves files in TIFF is a requirement for anyone using scanned images with page-layout programs. Publishers or graphic artists who want a device that can produce PMT-quality results will need a scanner that saves at least 6 bits per sample (64 gray tones); at

less than 6 bits you begin to notice banding between gray tones.

If you plan to print your scans only on a Laser-Writer, you won't make any resolution or gray-level gains by moving to a gray-scale scanner; bi-level or gray-scale, the best you can get on a 300-dpi printer is 16 gray levels and 75 lpi. That's not to say that you won't benefit from having a gray-scale machine. The ability to change the appearance of an image without rescanning is a feature that can save anyone time and money.

Of course, other considerations besides the number of bits per pixel a scanner saves will influence your decision about which machine is right for you. "Scanning the Horizon" (July 1986) includes a good discussion of the other factors—such as character recognition capability or the flatbed versus sheetfed issue—that should enter into your decision. □

See *Where to Buy* for product details.

who handle a staggering 500 calls a day—11,000 per month. Face-to-face assistance with complex problems comes from a small group of experts at the resource center.

But Seafirst's innovation is 130 employees who, in addition to their regular jobs, act as "paratrainers." Diane Wood took an introductory paratrainer class at the Pet Shop, followed by courses in specific Mac programs. Now she helps all the computer users on her floor. Fellow paratrainer Gail Gautestad observes that the paratrainers are effective partly because "we're still basically end users—not high-techies."

Some corporations buy training-and-support contracts from the dealers or consultants who supply them with hardware and software. Training programs, which cost from \$150 to \$350 per day for each employee, can be a very lucrative sideline for their providers. Students, however, sometimes complain that the courses are little more than walk-throughs of the training manual.

Another solution for corporations is third-party help. A San Francisco firm called Computer Hand Holding supports the Mac's top ten business products. According to president Emil Flock, the firm seeks business primarily from medium-size and large corporations that need high-volume help, don't want to staff a support department, or need to ease demands on their own information centers.

What does such service cost? A typical one-year contract provides 40 hours a week of telephone help, administration, and reporting for \$2500 a month. Additional time is \$50 an hour.

Getting What You Need

Even if you don't have an information center to draw upon, help could be closer than you think. In addition to checking the manual or calling the help line, consider the following often-overlooked resources.

- It may seem obvious, but since you're already at your Macintosh, check your program's help screens. Sometimes they're clearer and better organized than the printed manuals. Some may even have more information: Apple says the on-screen help for *HyperCard* is more complete than the (excellent) manual. *PageMaker* 2.0 uses an innovative on-screen hypertext help program.

- Seek out local experts. You can often find an associate or friend who is experienced with a given program. Many nonprofessional experts enjoy being asked to solve challenging problems.

- Your local Macintosh user group can be a wonderful source of expertise. Group bulletin boards are electronic extensions of local experts. The only disadvantage is that bulletin boards are often small operations whose lines are frequently busy. To find the user group nearest you, call Apple at 800/538-9696, ext. 500.

- Specialized bulletin boards offered by CompuServe, GEnie, and The Source network services let you reach out and ask the computer nation for help. Queries to these BBSs can easily generate a dozen responses. Simply browsing through the correspondence

can tip you off to bugs and fixes, compatibility problems, and other headaches. Smart software companies monitor these boards, announcing problems and fixes they've found and learning of new ones. Smarter companies—Living Videotext, Borland, Microsoft, Adobe, and Aldus—maintain forums of their own on the networks.

- Build a reference library of magazines and books that address programs you use frequently. Mark tips with highlighter pens and flag useful stories. (To make it easier to locate past articles, *Macworld* is working to put its indexes into *HyperCard* stacks. Watch for details as they develop.)

Calling the Company

Of course, you will want to call the software publisher. Prepare your questions first, and be ready with basic information such as your Mac's model and serial numbers, software version numbers, and so on (see "Before You Become a Bug"). Publishers legitimately complain about lazy callers. Layered's vice president of marketing, David O'Connor, reports that more than half the calls his company receives are on topics covered in the documentation (and half of those aren't

Seafirst Bank has created a variety of in-house resources to support its 2600 Mac users. Paratrainer Diane Wood (left) helps coworkers in addition to her normal job. June Honeycutt is a full-time trainer.

about *Insight* at all, but about Mac procedures like copying files). Acius president Guy Kawasaki says the reason his company doesn't have toll-free help lines is that "customers then call without even trying to read the manual."

The type of service you receive, once you get through to a software publisher, can vary considerably (see "Help Policies"). When phone lines get jammed, most publishers believe it's in the customers' interest to take their numbers and call them back, rather than keep them on hold. Charles Jackson, president of Silicon Beach Software, wants his tech support department to be able to answer all calls immediately. "No one ever talks about our tech support," says Jackson, "because it's so good. When we got to the point recently where we were having to return 12 calls a week, I added staff." According to tech support manager Mari Hughes, the department has now reduced the number of calls it returns each week to about 5, and she emphasizes that they're made "within five or ten minutes" of each incoming call.

Ironically Aldus, which has a good reputation, just moved to a hold system to improve service. "When customers call," says customer service manager Colleen Byrum, "it's because they're in trouble now, not one or two hours later when we call back." By increasing phone staff 40 percent, Byrum hopes to keep the maximum hold to about four minutes.

On the other hand, Microsoft's phone support has always drawn a lot of fire. The software giant's 20 Mac specialists get about 700 calls a day—that's 35 apiece each day. By way of comparison (although direct comparisons between companies are a little tricky), each member of the tiny Silicon Beach tech staff averages about 19 calls per day. One improvement Microsoft has

added is a computerized phone system that asks you to enter touch-tone numbers and then directs you to a Mac specialist. If you're using a dial phone, however, you still must wait for an operator.

When you call Microsoft, be sure to dial the number on the stub of your registration card, which, if you're lucky, you've kept with the instruction manual. Even though you may feel that it's you, not your software, who needs a little service, when you call Customer Service you'll discover you've dialed the wrong number; the help line you want is Product Support. (This departmental distinction may be clear to publishers but it's confusing to customers: generally, Technical Service or Product Support handles help questions; Customer Service tends to be a marketing arm that deals with registration, upgrades, and the like.)

Registered users of Aldus's *PageMaker* get 45 days of help (not toll-free) from the time of their first phone call, along with a guide to basic page design and a bimonthly newsletter. After that, you can buy a service contract for \$100 a year, which provides five hours of toll-free help, big discounts on new program versions, and other benefits.

Apple

The consensus among Mac users is that Apple's software help has been awful. Call Apple, and you're referred to your dealer. Good luck. Now Apple has created a new company, Claris, to sell its existing applications software and to market new programs. (Apple will retain the Mac's System software and *HyperCard*.)

John Zeisler, vice president of marketing, says Claris is going to give better service than its parent. That means "great telephone support," new ways to sample software before buying it, and a variety of ways to reach users with help. The specifics are still being worked out, Zeisler says, but the perspective is different. "We want to be closer to the customer. If customer support is being asked the same question ten times a day, we'll rewrite the manual. If that doesn't solve it, we'll push the problem up to engineering, and make the program easier."

Apple has recently formed something called the Apple Training Alliance. The Alliance is writing curricula for training companies and dealers, and the first curriculum is for desktop publishing. It teaches the use of *PageMaker*, *Word*, *PowerPoint*, *Illustrator*, and *SuperPaint*.

The emphasis here is on the big-bucks training market, not the cash drain of consumer help. But one of Apple's qualification standards for the program is that people who take a Training Alliance course must

Aldus technical support manager Ben Bauermeister lugs a stack of completed call reports. The 15 tech support reps take some 500 calls a day (the entire support department numbers about 31).

HyperDrive owner Terry Shelton (now on his fourth drive) calls GCC's support nonexistent. Although he has a service contract, he has never received notice about upgrades to make the drives work with new Apple Systems.

wholesaling firm. When Shelton called General Computer about his HyperDrive hard disk, GCC told him to call his dealer (Ping!), who knew nothing (Pong!). So Terry called GCC back and sat on hold "forever." All he wanted to know was whether there was a new version of HyperDrive's system software, since his version was crashing with Apple's newest System. (There was a new version, but GCC hadn't notified its customers.) Now Shelton is broadcasting his plea for help—and his strong feelings about GCC's service—on user-group bulletin boards.

Another trend that's raising the frustration level of many users is the increasing tendency of publishers to shift the burden of software support to customers. To cut costs, many publishers are quietly converting toll-free phones to regular lines. Others are raising software prices. Borland, for example, raised the price of the new release of its *Reflex* relational database manager. It did so partly because of the upgrade's new features and partly because the average call for help lasts 20 minutes, and Borland picks up the tab.

Of course, another solution to the rising cost of help lines is simply not to increase support staffs to meet the growing number of calls, which leaves irritated customers on half-hour long-distance holds.

But the most controversial trend on the software help scene is the tendency of companies to limit the help customers get with a software purchase; after an initial period of free support, the customer is charged for services rendered. Pay services are particularly favored for very specialized programs, such as high-end accounting packages, and by big software companies that sell complex programs to corporate customers. Ashton-Tate's plan is typical. You get 90 days of un-

limited (but not toll-free) help calls. After that, you choose among three contracts costing from \$50 to \$150 a year for a limited number of calls (\$150 buys you a contract that includes 20 calls and a package of publications). Contracts for corporations can cost up to \$995. As the Mac goes increasingly corporate, expect more service of this type.

Manual Labor

Then there are the instruction manuals or, as they're known in techno-jargon, *documentation*. Many talk gibberish. Can you understand the instructions on how to create style sheets in *Microsoft Word 3.0*? Can you decipher runes?

Other manuals talk down. The 185-page instruction book for *MicroPhone*, a relatively easy-to-use communications program, begins by assuming you know how to work a Mac. Forty-six pages later, it still explains dialog-box choices like this: "Move the mouse pointer over the round button labeled with the Baud rate you wish to change to. Click the mouse button and the on-screen button that you have chosen will highlight." In other words, click on the baud rate you want. After wading through the manual, written in 1985, you can check the addendum, written in June 1987, to find what has changed in the procedure you just learned. Then you can check the Read Me First! document on *MicroPhone*'s disk for last-minute alterations to the changes.

Perhaps that illustrates the central problem of the help conundrum—there's no central source. You ricochet from manual to dealer to publisher, frustrated and angry as you fritter away the time that computers are

supposed to save. And even if you do find your answer quickly 80 or 90 percent of the time, the bad experiences are the ones you remember.

Corporate Solution

Some large companies have recognized the inefficiency of individual employees' calling software publishers or dealers for help. One such company, Seattle's Seafirst Bank, set up an information system that offers the users of its 2600 Macs a variety of help options.

Seafirst employees receive basic computer training and courses on software programs from an information center officially called Professional Electronic Tools but nicknamed The Pet Shop. For phone help, workers can call a help line staffed by 13 specialists

HELP!

Where do you turn when your programs have problems?

Y

ou bought a hot new \$395 word processing program last month, and it's got every feature in the book. Unfortunately your programming wonder won't print correctly with your \$5000 LaserWriter. The word processor's instruction book reads as if it were translated from a foreign language, so you phone your dealer. Your salesman, who said he wanted a long-term business relationship ("Just call any time you need help..."), quit last week. His replacement tries to sell you a Mac II.

Since the problem could be in the printer, you call Apple, long-distance. A voice there explains that all support is given through dealers.

Well, maybe the problem is with the word processor—your other programs print. You call the software publisher's customer support number, long-distance. After all, you're a customer and you need support. You get a busy signal for the first five tries and then, when you finally connect, a recorded voice tells you to call Technical Support. After several tries, you're put on hold. You use the 20-minute wait to browse through back issues of your computer magazines for a vaguely remembered mention of your problem. Can't find it.

When a technical support representative comes on the line, you explain the difficulty. "Oh, yeah," she says knowingly. "It's a glitch in the LaserWriter. You'll have to call Apple." Then she reminds you that the support service that came with your software expires next month. If you want continued help, you should sign up now for just \$75 a year. Next month, the same coverage will be \$99.95.

Have a nice day.

Help Headaches

When the Mac first came out, *MacWrite* and *MacPaint* were revolutions in user-friendliness. Both programs were easy to learn, and they worked. If you

by Michael Alexander

were a complete klutz, your dealer explained how to change the ruler settings. Enthusiastic industry pundits predicted computers would soon become so intuitive that documentation and software support would be unnecessary. Macintosh TV ads showed a 10-pound stack of IBM manuals crashing like bricks onto a desk, followed by the soft plop of a slim Mac manual.

Today you could flatten your mouse trying a similar stunt with Mac documentation. Some of today's Mac programs come with two- or three-volume instruction manuals, not to mention the tapes, videos, and training courses. Today's Mac is more complex, the Mac marketplace is more crowded, there's more hardware and software and more features. The Mac's success has many users pleading for help, and some are having a hard time getting it.

One reason good help is hard to find involves the dealers, who are the major support channel for most people. A recent *Macworld* survey showed that more than 40 percent of readers are dissatisfied with their dealer service. It's disillusioning to discover that the person who sold you your hardware doesn't know anything about writing macros in *Excel*.

The reasons for such ignorance are no mystery. The commission for selling a \$400 spreadsheet program is a fraction of that for a \$5000 Mac II, and since the amount of sales and support time can be the same, guess where the effort goes? For their part, dealers say customers' expectations are unrealistic. "I have 200 pieces of software on the shelves," says Ken Petracek, manager of the computer division of CW Electronics in Denver, "but people find it frustrating that I don't know every program in depth."

Then there's customer Ping-Pong. It happened to Terry Shelton, operations manager of a San Francisco

who handle a staggering 500 calls a day—11,000 per month. Face-to-face assistance with complex problems comes from a small group of experts at the resource center.

But Seafirst's innovation is 130 employees who, in addition to their regular jobs, act as "paratrainers." Diane Wood took an introductory paratrainer class at the Pet Shop, followed by courses in specific Mac programs. Now she helps all the computer users on her floor. Fellow paratrainer Gail Gautestad observes that the paratrainers are effective partly because "we're still basically end users—not high-techies."

Some corporations buy training-and-support contracts from the dealers or consultants who supply them with hardware and software. Training programs, which cost from \$150 to \$350 per day for each employee, can be a very lucrative sideline for their providers. Students, however, sometimes complain that the courses are little more than walk-throughs of the training manual.

Another solution for corporations is third-party help. A San Francisco firm called Computer Hand Holding supports the Mac's top ten business products. According to president Emil Flock, the firm seeks business primarily from medium-size and large corporations that need high-volume help, don't want to staff a support department, or need to ease demands on their own information centers.

What does such service cost? A typical one-year contract provides 40 hours a week of telephone help, administration, and reporting for \$2500 a month. Additional time is \$50 an hour.

Getting What You Need

Even if you don't have an information center to draw upon, help could be closer than you think. In addition to checking the manual or calling the help line, consider the following often-overlooked resources.

- It may seem obvious, but since you're already at your Macintosh, check your program's help screens. Sometimes they're clearer and better organized than the printed manuals. Some may even have more information: Apple says the on-screen help for *HyperCard* is more complete than the (excellent) manual. *PageMaker* 2.0 uses an innovative on-screen hypertext help program.

- Seek out local experts. You can often find an associate or friend who is experienced with a given program. Many nonprofessional experts enjoy being asked to solve challenging problems.

- Your local Macintosh user group can be a wonderful source of expertise. Group bulletin boards are electronic extensions of local experts. The only disadvantage is that bulletin boards are often small operations whose lines are frequently busy. To find the user group nearest you, call Apple at 800/538-9696, ext. 500.

- Specialized bulletin boards offered by CompuServe, GEnie, and The Source network services let you reach out and ask the computer nation for help. Queries to these BBSs can easily generate a dozen responses. Simply browsing through the correspondence

can tip you off to bugs and fixes, compatibility problems, and other headaches. Smart software companies monitor these boards, announcing problems and fixes they've found and learning of new ones. Smarter companies—Living Videotext, Borland, Microsoft, Adobe, and Aldus—maintain forums of their own on the networks.

- Build a reference library of magazines and books that address programs you use frequently. Mark tips with highlighter pens and flag useful stories. (To make it easier to locate past articles, *Macworld* is working to put its indexes into *HyperCard* stacks. Watch for details as they develop.)

DAN ESCOBAR

Board Games

Michael R. Hoffmann's law firm in Des Moines owns eight Macintoshes. Six have never needed repairs. But two Mac 512Ks have burned up five power supplies between them. After reading in *Macworld* that others have had similar experiences, Hoffmann decided he might not just be having bad luck.

Smoke Gets in Your Eyes

Inside the Mac are two electronic boards. The system board lies flat on the machine's bottom and performs computations. The analog board is mounted vertically on the Mac's left side and includes the power supply, the video sweep circuitry, and the loudspeaker. The Mac is generally a reliable

machine, but the analog board has been a continuing source of trouble and controversy.

When an analog board blows, your Apple dealer swaps the smoking relic for another board, then usually tells you (as did Hoffmann's dealer) that the problem was the power supply. Perhaps as a result there is a widespread belief that the Mac 128K, 512K, and 512KE power supplies are too small.

But John Sawyer, partner and chief technician of CJS Systems in Berkeley, California—a Mac-techie heaven that does upgrades and repairs—says the Mac isn't underpowered. In fact, the problem could be nearly anything on the analog board. Most of the time, Sawyer says, the culprit is the flyback

seen very few analog-board problems in those models.

But that hasn't fixed Michael Hoffmann's flaming 512Ks (which, according to Hoffmann, actually just "smoked a lot"). In June he complained to Apple, asking for reimbursement for the bad boards he's replaced and either a permanent fix, replacement Macs, or a refund of the machines' fair market value (about \$1,100 each). In September, Apple offered new boards and a free one-year service contract. Hoffman thinks Apple's offer suggests it hasn't solved the underlying problem. When this article went to press, he'd counteroffered: Hoffman was willing to settle if Apple reimbursed him \$589.68 for his repair bills and covered the new boards' installation charges.

Repair, Replace, or Rip-off

If your Mac's out of warranty and an electronic component does fail, you can replace just the component or you can replace the entire board. Apple wants dealers just to swap boards, which doesn't require as much technical talent as repairing them. As a result, you can save money if you can find a good shop to do the repairs. CJS charges \$108 to replace the flyback transformer and associated parts. But how much you save depends on what your local authorized Apple dealer charges. A random phone survey of dealerships nationwide brought in quotes from a low of \$143 to a high of \$268 for installing a new board.

John Sawyer of CJS Systems contemplates his collection of failed flyback transformers—the real culprits in many so-called power supply failures.

transformer—part of the video circuit. As proof, he points to a box of several hundred failed units. Sawyer says Apple substituted a beefier flyback transformer in the Mac Plus and SE and in late 512KEs, and he's

DAN ESCOBAR

be offered follow-up help, though it's not likely to be free, nor to last forever.

Know Your Rights

What should you expect when you buy software? The following software bill of rights is based on numerous conversations with both users and publishers. We're talking common sense and good business prac-

tices here, not the law, which lags far behind this fast-moving industry.

■ The program should work. No program is completely bug-free, particularly when first released. But, says Daniel Chayfetz of Odesta, maker of *Helix*, "When users pay hundreds of dollars for a product and then find hundreds of bugs, they're paying to be beta test sites." Many users felt that way after they bought *Microsoft Word 3.0*. Bulletin boards crawled with reports of

more than 400 bugs by the time Microsoft rushed a free upgrade.

■ The program should fulfill its advertised promises. *Insight*, Layered's excellent accounting package, advertised that it would show dollar amounts to five decimal places. That capability was important to Steven Pinsky, owner of SRO, a film- and video-sound service in San Francisco; Pinsky might bill a customer \$0.0655 per foot of magnetic film. But *Insight*'s first release showed amounts to only two decimals, falling somewhat short of the billing accuracy SRO needed and expected. Layered helped Pinsky work around the problem, but *Insight*'s deficiency burdened SRO, and Pinsky thinks Layered should have offered a partial refund or credit.

The new *Insight* release shows dollar amounts to five decimal places, and has been offered (for \$15) to all registered users, but it took Layered 14 months to correct the problem. "A handful" of buyers got their money back, according to Layered's David O'Connor, but he concedes that customers like Pinsky who were inconvenienced got no breaks. He points out that all customers have received free help since July 1986, though Layered hasn't publicized the fact. Pinsky says Layered's help has been top-notch. But he notes that a mailing-label feature also promised originally still isn't in the new release.

Support policies of 12 representative software publishers. The information in this table reflects policies in force at press time.

Before You Become a Bug

About to call a software publisher for help? *Macworld* based this phone-support checklist on suggestions from Colleen Byrum, manager of customer service at Aldus. Follow it for faster answers and lower phone charges when you call a publisher.

- Register your purchase. Amazingly, only 30 to 60 percent of software buyers send in their registration cards. Most publishers won't answer your questions if you're not on file.

- At least try to read the manual. If it isn't clear, let the company know that's why you had to call for help.

- Try to identify the prob-

lem's source. If you've been found by a bug, immediately write down what sequence of events led to the crash. If the problem is a new one, did you do something you'd never done before? If you repeat your actions, does the problem occur again? Are you having strange problems with other programs, or just with one? "Mac Troubleshooting Tools" in the April 1987 *Macworld* outlines basic procedures for analyzing whether your difficulty comes from system or hardware problems, or from a glitch in the software.

- Have the numbers ready. Most phone techies will want

you to provide the serial number of the program and the service contract number if you have one. Other information you're likely to be asked for includes your Mac's model; the amount of RAM installed; the names of any upgrade boards; and the version number of the System, the Finder, and the program you're using.

If you're on a network, they'll also want the name of the file server and the version number of its System software, the number of users on the network, and whether users share a System file or have their own.

Comments

45-day help limit begins with first call; toll-free phone number; one-year single-user service contract, \$100.

Apple recommends contacting dealer.

60-day help limit begins with registration; one-year single-user service contract, \$95-\$195.

Toll-free phone number.

Centram says it will soon be selling limited, single-user service contracts.

- The program should have clear and complete instruction manuals.

- The program should be intuitive. You have a right to expect things to work the way you expect them to work.

- Fast and frequent information. Publishers should try new ways to get new information to you: bulletin boards, newsletters, tip and tech sheets, upgrade notices. How easily you get phone help tells you a lot about the publisher's commitment to its product and customers.

- If you're a registered owner, the publisher should notify you by mail about program upgrades and offer you substantial discounts on revisions that include major changes and improved features. Upgrades that primarily fix bugs should be sent free.

- No buck-passing. If you're using a reasonably standard combination of software and hardware, a call for help to one company should get you a solution, not a referral. It's the developers' responsibility, not yours, to make their products work together. □

See *Where to Buy* for product details.

The Ethernet Solution

*Ethernet brings
high performance to
Macintosh networks*

by Brita Meng

Until recently, if you wanted to network Macintoshes, AppleTalk was the only solution. Of course you could purchase alternative cabling systems, such as Farallon's PhoneNet, but regardless of the cable you chose, the 230K bits-per-second speed limitation remained. Because AppleTalk is a network architecture—not just the connector boxes and cables attached to the Mac—Apple was able to develop EtherTalk, a speedier yet compatible alternative to the original AppleTalk network (now dubbed the AppleTalk Personal Network). EtherTalk, based on standard Ethernet cabling, maintains compatibility with existing AppleTalk software and offers networkers a much higher performance alternative.

Originally designed at Xerox in 1976, Ethernet is a high-speed communications medium that allows information to travel over the network at up to 10 megabits per second. Because Ethernet is also a standard adopted by the Institute of Electrical and Electronic Engineers (IEEE), almost every computer—now including the Mac—has access to Ethernet. This includes the supercomputers from Cray, the VAX from Digital Equipment Corporation, the IBM PC, and UNIX workstations, such as those from Sun Microsystems and Apollo Computer.

Like the AppleTalk Personal Network, in its simplest form Ethernet is configured as a bus—a single ca-

ble open on both ends—as opposed to a ring or loop system. Conceptually, an Ethernet network looks something like a tree, whose limbs are nodes (individual computers) and whose trunk is the Ethernet cable.

Installation of cable is usually the most costly part of setting up a network. Ethernet provides several wiring schemes that span a range of price and performance (see “Choosing Your Cable”).

The physical connection to the Ethernet cable is made by a connector, or *tap*. Different types of cable use different types of taps. A tap connects to an Ethernet transceiver, which handles the receiving and sending of information over the cable. Finally, the computer-resident Ethernet controller is responsible for assembling and disassembling data into packets so the Mac can transmit and receive information across the network.

Network Configurations

One way to use Ethernet is as a local area network (LAN). This connects every Mac in a work group

with Ethernet cable. For example, an engineering work group may need to access and share very large CAD files on a network file server, or perhaps several users need to access one large database. Using Ethernet speeds up the network for such applications.

If the problem is not to get information to and from group members, but rather to get information to and from different work groups altogether, an Ethernet *backbone* (a central thoroughfare with tributary networks) may be the logical solution. This configuration fills the bill for departmental communications networking. For example, an Ethernet backbone might link separate AppleTalk work groups, themselves connected with twisted-pair wire, PhoneNet, or even Du Pont's fiber-optic AppleTalk. If you already have AppleTalk networks, there's no need to rewire them for an Ethernet backbone.

Because Ethernet is a *multiple-protocol medium*, several networking protocols—for example AppleTalk, DECnet, and TCP/IP—can run on it simultaneously. This capability lets you to create a corporate networking

scheme, connecting all types of computers, without having to install different cables for each type of network connection—or worse, having to rewire a previously established network.

Name Your Protocol

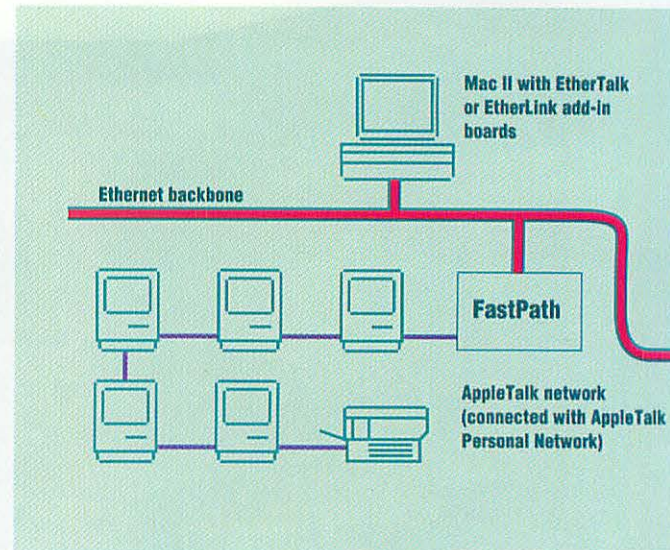

Software protocols are necessary to run network services, such as E-mail and file servers, and also to guarantee reliable transmission and reception of data over the network. Even the AppleTalk Personal Network cable is useless without the AppleTalk protocols, the set of rules that govern communication over the twisted-pair wire. The same is true for Ethernet. Once you've connected the Macs with Ethernet cable, you still need the network protocols to communicate via Ethernet.

A full-fledged network requires an entire suite of protocols. Each protocol in the suite has various responsibilities. To help organize the protocols, the International Standard Organization (ISO) has developed a networking reference model that makes it easier for companies to ensure that different computers can talk to each other. The AppleTalk network architecture is a complete implementation of the ISO reference model.

The Ethernet standard is an integral part of the ISO model. Consequently, many different networking protocols can run over Ethernet. Because different computers use different protocols, the type of protocol

Steve Nelson (foreground), vice president of marketing for Kinetics, and Subhash Bal, Excelan's vice president of marketing. Excelan's acquisition of Kinetics now links the Mac to Excelan's existing TCP/IP product line.

your network needs depends on the type of computer (or computers) you will connect to your Mac.

EtherTalk

Apple's EtherTalk is a high-speed alternative to the AppleTalk Personal Network. EtherTalk lets you run AppleTalk protocols directly over Ethernet, rather than over the traditional twisted-pair wire. Thus, AppleTalk networks take advantage of Ethernet's speed and capacity. A single EtherTalk network can include up to 254 nodes and 1000 meters of cabling.

EtherTalk and the AppleTalk Personal Network use the same upper-level protocols—for example, the AppleTalk Filing Protocol (AFP). As a result, most application software runs with both AppleTalk architecture implementations, regardless of the type of cable that connects the network's computers.

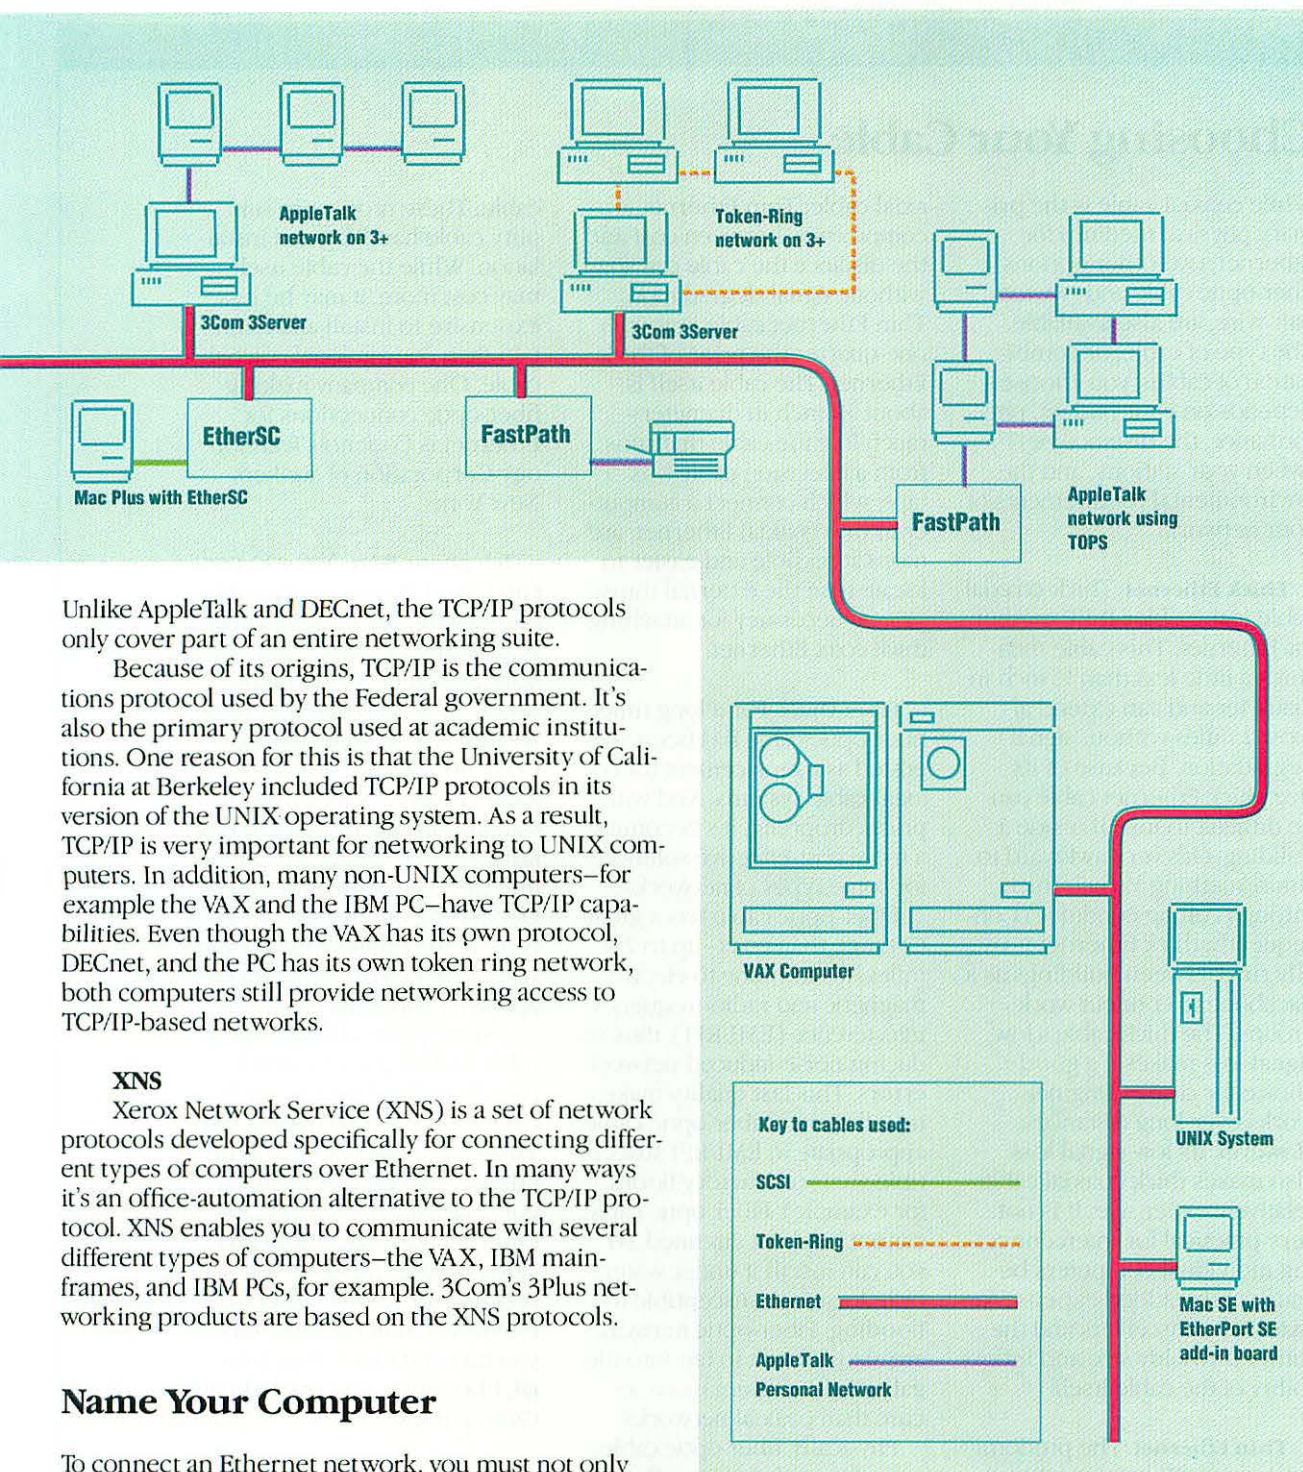

DECnet

Digital Equipment Corporation has its own networking/communications framework called Digital Network Architecture (DNA). DECnet is the name given to the set of software protocols necessary to adhere to DNA. The primary communications medium used for DECnet is Ethernet cable.

DECnet is similar to the AppleTalk architecture. It has its own complete suite of protocols for everything from E-mail to file directories. Both DECnet and AppleTalk are protocols for specific computer families, developed by the computer system vendors. Both protocols offer high-level network services such as file sharing and E-mail. If your Mac has access to DECnet protocols, you can take advantage of the services the DEC environment offers.

TCP/IP

TCP/IP (Transmission Control Protocol/Internet Protocol) is a set of protocols used to transfer data on Ethernet. Developed by the United States Department of Defense, TCP/IP is a de facto industry standard for communications between different computer systems.

Unlike AppleTalk and DECnet, the TCP/IP protocols only cover part of an entire networking suite.

Because of its origins, TCP/IP is the communications protocol used by the Federal government. It's also the primary protocol used at academic institutions. One reason for this is that the University of California at Berkeley included TCP/IP protocols in its version of the UNIX operating system. As a result, TCP/IP is very important for networking to UNIX computers. In addition, many non-UNIX computers—for example the VAX and the IBM PC—have TCP/IP capabilities. Even though the VAX has its own protocol, DECnet, and the PC has its own token ring network, both computers still provide networking access to TCP/IP-based networks.

XNS

Xerox Network Service (XNS) is a set of network protocols developed specifically for connecting different types of computers over Ethernet. In many ways it's an office-automation alternative to the TCP/IP protocol. XNS enables you to communicate with several different types of computers—the VAX, IBM mainframes, and IBM PCs, for example. 3Com's 3Plus networking products are based on the XNS protocols.

Name Your Computer

To connect an Ethernet network, you must not only have the proper Ethernet hardware for each computer but also the software drivers that implement the specific protocols. In some cases, the hardware comes complete with the software drivers. In others, mixing and matching hardware and software from various communications vendors is necessary.

Mac-to-Mac

To implement EtherTalk, you need a hardware Ethernet controller for each Mac and the AppleTalk protocol software support for the Ethernet controller. The networking protocols for EtherTalk and AppleTalk

Figure 1

Individual Macs as well as entire AppleTalk-based workgroups can communicate with one another and with larger VAX and UNIX-based systems over an Ethernet backbone.

Choosing Your Cable

While coaxial cable is the primary physical medium for Ethernet, two other options, fiber-optic cable and twisted-pair wire, are also available. The type of cable, or combination of cables, you choose depends on your budget, performance, the distance between your stations, and the environmental requirements of your network.

Thick Ethernet Thick coaxial cable is the older IEEE medium for Ethernet. This cable measures a little less than 1/2 inch in diameter and can extend almost 2 miles without signal degradation. Because of its size, thick Ethernet cable can be difficult to install inside a building. (It's very awkward to run something 1/2-inch thick through ceiling conduits.) Consequently, thick Ethernet is usually run between buildings as a backbone to connect work groups. The thick cable's low signal loss makes it a good choice for connecting networks over long distances. However, its low signal loss also makes thick coaxial cable relatively expensive. It is not very practical for interconnecting individual computers because of the added expense for external transceivers and the rather unwieldy size and inflexibility of the cable itself.

Thin Ethernet The predominant type of Ethernet cable now being installed is thin co-

axial cable. Thin Ethernet is a compromise between cost and the distance the cable can span without signal degradation. Thin Ethernet cable is about one-quarter the price of thick Ethernet. The cable itself is about 3/16 inch in diameter—much like the cable that runs from a television cable box. Taps, which connect a computer to thin coaxial Ethernet, are more accessible and easier to locate than the external transceivers necessary for attaching thick coax Ethernet.

Fiber-Optic For a long time, fiber-optic cable has been suggested as a replacement for coaxial cable systems. And with prices dropping, it's becoming a more cost-effective solution for some types of networks.

Fiber-optic cable has a greater range than coax—up to 2 1/2 miles. It's immune to electromagnetic and radio-frequency interference (EMI/RFI), thus reducing noise-induced network errors. This last quality makes installation of fiber-optic cable appropriate in EMI/RFI-susceptible areas (on factory floors, for example). Fiber-optic cable cannot be short-circuited, so you can install it under water or in locations susceptible to flooding. Fiber-optic networks are also difficult to tap into illegally, making them more secure than coaxial networks.

Physically, fiber-optic cable is smaller, lighter, more flexible, and more elastic than coaxial

cable. These properties simplify cable handling and installation. While the cable itself may cost more, it may be less expensive to install and maintain than conventional coaxial cable. One company making fiber-optic connections for Ethernet is Codenoll Technology Corporation of Yonkers, New York.

Telephone Wire You can now run Ethernet over existing telephone wire. 3Com's PairTamer is an adapter that lets you install standard Ethernet on an unused pair in a typical telephone wiring bundle. Like Farallon Computing's PhoneNet, the adapter takes the place of the standard modular phone outlet. Ethernet and a voice telephone line can coexist on PairTamer. Depending on the number of pairs in the phone wire bundle, you can also have simultaneous access to AppleTalk.

A short piece of thin coaxial cable (called a *drop cable*) runs from PairTamer to each computer. You must have a PairTamer on the other end of the Ethernet telephone line for a good signal. To configure an Ethernet network, 3Com provides MultiConnect, which acts like the phone closet for PhoneNet. MultiConnect lets you mix and match thin coaxial, fiber-optic, and twisted-pair cabling lines.

are the same. Any other AppleTalk network device, such as a LaserWriter, also needs access to the Ethernet cable.

Developed jointly by Apple and 3Com, the EtherTalk Interface Card is a Mac II add-in board that offers direct access to Ethernet. 3Com also plans to sell its own version of the Mac II EtherTalk card, which it will

call EtherLink. The Apple and 3Com boards will be exactly the same. The EtherPort SE board from Kinetics provides the Mac SE with an Ethernet connection. All three boards allow you to use either thick or thin coaxial cable.

Also from Kinetics, EtherSC uses any Mac SCSI connector to hook into an Ethernet network. And to

connect a LaserWriter, you'll need an AppleTalk-to-Ethernet gateway, such as Kinetics' FastPath. FastPath has one AppleTalk and one Ethernet connector. So if you want to configure a local EtherTalk network, simply use the FastPath to connect a LaserWriter or any other AppleTalk device that does not have Ethernet access.

FastPath also allows you to connect entire AppleTalk networks to an Ethernet backbone. These workgroup networks can be linked either with traditional twisted-pair wire (AppleTalk Personal Network) or with PhoneNet.

The EtherTalk Interface Card, EtherLink, EtherPort SE, EtherSC, and FastPath are all configured to allow true Mac AppleTalk software to use Ethernet transparently. Since EtherTalk is really AppleTalk, you can still use all your present AppleTalk-based applications, such as E-mail and file servers.

Non-Apple Machines

Because of standardization, Ethernet is a good way to network the Mac to other types of computers. There are two ways to provide communications software compatibility between the Mac and other machines. One method is to implement AppleTalk protocols on the "foreign" computer. By putting AppleTalk protocols on other machines, you maintain the Mac interface over the network. For example, you can run AppleShare using a VAX as a file server—or use a VAX as a print queue for a LaserWriter.

The second method of implementing protocol compatibility puts other non-AppleTalk protocols, say DECnet or TCP/IP, on the Mac. In some cases, the protocol software, or *driver*, is sold separately; in others, the driver for a particular protocol comes with the Ethernet controller.

PCs and the Mac

Three PC-Mac network solutions use the AppleTalk protocols, with AppleTalk running on the PC. However, none of the manufacturers currently offers a PC Ethernet board for the EtherTalk protocols.

Apple's *AppleShare PC* requires the AppleTalk PC card for the IBM. At present this card does not offer an Ethernet connection. While Apple did design the AppleTalk PC card, it has no plans to design the hardware for a PC Ethernet controller with AppleTalk protocols. Such a board will have to come from a third-party developer. Although numerous Ethernet controllers are offered for the PC, none currently implement the AppleTalk protocols.

TOPS is working on a solution for *TOPS PC* access to EtherTalk. Its TOPS Interface Card currently works only with the AppleTalk Personal Network twisted-pair wire. In addition, Tangent Technologies is rewriting its *PC MacBridge/AFP* software so that IBM PCs can access the *AppleShare* file server with EtherTalk. The company is talking to several PC Ethernet board manufacturers about combining its software with PC Ethernet boards.

3Com uses the XNS protocols, instead of the AppleTalk protocols, to enable file sharing between

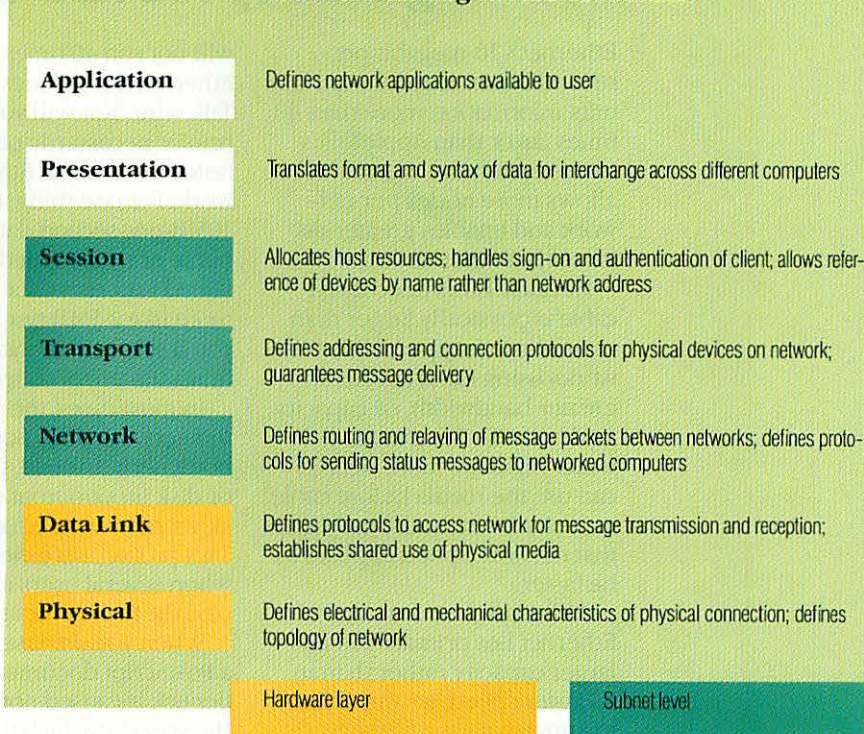

PCs and Macs. In this case, the 3Server3 hardware is the gateway between the PCs and the Mac. The 3Server3—actually a PC using a 3Com-modified version of MS-DOS for a network operating system—not only routes XNS packets from the Mac to the PC, and vice versa, but is also a file server. Each server can support two networks simultaneously.

Right now 3Com's 3+ software supports three types of networks with XNS: AppleTalk, Ethernet, and Token-Ring. There is no direct connection for AppleTalk to Token-Ring currently, although 3Com does expect to release one in early 1988. Consequently, these two local area networks must use Ethernet to talk to each other.

In such a setup one 3Server3 is configured as a Token-Ring/Ethernet server; another as an AppleTalk/Ethernet server. By connecting the two servers with Ethernet, you can network the two different network types. XNS is the intermediary protocol between the two. 3Com is now implementing the EtherTalk version of XNS translation software so that you will be able to network the Mac SE and Mac II directly into the 3Server3 over Ethernet. You can use either the EtherLink or EtherPort SE controllers for the Mac. At this time 3Com has no plans to support a SCSI-to-Ethernet connection.

Another way to connect the Mac to the PC via Ethernet link is by using a foreign protocol, namely TCP/IP, on both machines. There are several vendors of TCP/IP and Ethernet controllers for the PC. PC Excelan

ISO Networking Reference Model

of San Jose, California, Bridge Communications of Mountain View, California, and Micom-Interlan of Boxborough, Massachusetts are examples of companies that provide Ethernet controllers and TCP/IP protocol support for the PC.

On the Mac side, Pacer offers a version of its *pcLink* software for TCP/IP protocols. *pcLink* provides terminal-emulation and disk-server functions over Ethernet, via Kinetics' Ethernet controllers.

Computers from DEC

Two products run AppleTalk protocols over Ethernet (or EtherTalk) to network the Mac with the VAX. AlisaTalk, from Alisa Systems, enables the Mac to access services on the VAX computer via FastPath. Pacer Software's AppleTalk version of *pcLink* also implements AppleTalk protocols over Ethernet, giving Macs access to VAX computers for terminal emulation and disk sharing.

Based on Ethernet, DECnet networking protocols are available on the Mac from two double-vendor teams. Alisa Systems and Thursby Software Systems provide DECnet for the Mac. This networking package, called TSSnet, supports DECnet over Ethernet or asynchronous RS-232 lines. Ethernet access is via Kinetics' EtherSC or EtherPort SE controllers, which are also supplied by Alisa.

TSSnet attaches the Mac to DECnet so that the Mac looks exactly like a DEC node—no different from any other VAX on the network. It enables remote terminal access, file transfer, and remote file-access services over DECnet. In addition, a background listener allows you both to receive and to send VMS mail to DEC *All-In-One* users. Because the Mac is a DECnet node, it has equal client and server status with other DEC computers. As a result, you can edit a Mac file with a VAX-resident editor.

Dove Computer Corporation and Technology Concepts have jointly developed a DECnet solution for the Mac. The Mac accesses DECnet with Dove's FastNet Communication Control Unit. FastNet connects to the Mac via the SCSI port or RS-422 serial port; an Ethernet cable port connects the FastNet to the network. CommUnity, from Technology Concepts, is a portable implementation of DECnet. Like TSSnet, it also provides remote-terminal, task-to-task communications, and remote file-transfer and file-access services.

FastNet is an intelligent controller, with its own microprocessor and memory. This means that FastNet handles some of the lower-level DECnet communications overhead, resulting in a performance improvement under a heavy network load. However, because parts of the DECnet software reside in the FastNet, you need FastNet in order to run CommUnity. You can't use

Boosting Your Speed and Capacity

Ethernet's 10-megabit-per-second data rate means it transmits information more than 40 times faster than AppleTalk's twisted-pair wire. Coaxial cable allows more nodes per network and enables greater distances between nodes.

Because Ethernet coaxial cable is physically larger than twisted-pair copper wire, networks using Ethernet have greater bandwidth, or capacity. And because Ethernet is a wider highway, more people can use the media before cable capacity is reached. That means that network speed appears to be faster.

Although the advantage of Ethernet lies primarily in its larger capacity rather than in its faster speed, it's important to know that your file server

will not run 40 times faster on Ethernet than it does on AppleTalk wire. Nor will your laser printer necessarily print any faster if it is on an Ethernet network. For one thing, Ethernet's 10MB-per-second data rate is a burst, or peak, speed; the sustained Ethernet data rate is more like 2.5MB per second. So you'll see only an increase of 10 times the previous speed.

In most cases, the speed of the network does not cause the bottleneck. Instead, CPU speed or disk input/output (I/O) time slows network performance. This problem is exacerbated when several users all try to access the file server at one time.

When you are laser printing a PostScript document, the bottleneck is caused not only by the speed at which the Mac can

generate a PostScript file, but also by the speed at which the laser printer can print. In fact, tests done at Apple showed that in the 2000 seconds it took to print one document, only 8 seconds were spent on the network. If you use a direct Ethernet connection for a LaserWriter, you will see no difference in print speed.

You should expect a moderate improvement running *AppleShare*, especially if your network is large. The real speed gain comes if you have a Mac II server/client combination for *AppleShare* (simply because of the faster Mac II processor). Apple reports that a Mac II on Ethernet can result in file server performance similar to SCSI access speed for a hard disk.

Software by Protocol

Protocol	Product	Company	Price	Comments
AppleTalk	AlisaTalk	Alisa Systems	\$3750 to \$11,500	Connects Mac to VAX; includes file-server, print-spooler, and remote-terminal modules; compatible with entire line of Kinetics products.
	AppleShare PC	Apple Computer	n/a	Implements AppleTalk protocols on PCs so PCs can be part of AppleShare; requires AppleShare PC card for PCs.
	EtherTalk	Apple Computer	\$699	AppleTalk Personal Network option for running AppleTalk applications; requires Ethernet hardware controllers with AppleTalk protocol support.
	K-Talk	Kinetics	\$875 to \$3500	Implements AppleTalk protocols for UNIX systems; K-Term terminal emulator and K-Spool UNIX-based Laser-Writer spooler also available.
	pcLink	Pacer Software	\$2000 to \$37,500	Communicates directly to VAX systems, with AppleTalk protocols on VAX; includes terminal emulation, file transfer, virtual disk, and host printer access.
	TOPS	TOPS	\$189 to \$239	Uses AppleTalk protocols to connect Macs, PCs, and UNIX systems; PCs and UNIX systems require TOPS Network Interface Card; allows computers to share files, disks, and peripherals directly; no PC Ethernet access yet.
TCP/IP	pcLink	Pacer Software	\$2000 to \$37,500	Implements TCP/IP protocols on Mac for networking to UNIX systems; includes terminal emulation, file transfer, virtual disk, and host printer access.
	TOPS Terminal	TOPS	n/a	Provides AppleTalk link to TCP/IP networks; runs via AppleTalk/Ethernet bridge such as FastPath; offers multiple terminal-emulation windows and transparent file editing across environments.
DECnet	CommUnity	Technology Concepts	\$400	Connects Mac to VAX, with Mac as DECnet node; provides virtual terminal and VT220 emulation, task-to-task communications, remote file access and transfer, network management; requires FastNet Ethernet controller from Dove Computer.
	Alisa TSSnet	Alisa Systems	\$299 to \$349	Connects Mac to VAX, with Mac as DECnet node; provides file transfer, VMS mail with background listener, remote-terminal service; uses Kinetics EtherSC or EtherPort SE (supplied by Alisa).
XNS	3+	3Com	\$495	Supports IBM PC and Macs over 3+ network; AppleTalk and Token-Ring protocols sent via XNS over Ethernet; 3Server translates and filters information; supports EtherLink, EtherTalk, and EtherPort SE interface boards.

CommUnity with the Ethernet controller from Kinetics, which doesn't have the lower-level DECnet protocols installed.

UNIX Systems

Kinetics' *K-Talk* and TOPS's *TOPS* both provide AppleTalk protocols for UNIX machines. You install Kinetics FastPath/M or FastPath/Q boards to bring Apple-

Talk protocols to the UNIX host. The *K-Talk* software runs on the Mac and lets Macs communicate with the UNIX host via AppleTalk protocols over Ethernet.

TOPS for UNIX has the capability to connect Macs, PCs, and UNIX systems using its own TOPS command language. *TOPS* software translates network requests from the TOPS command language into UNIX commands, and vice versa. The UNIX computer is

ISO Reference Model

	AppleTalk	UNIX	XNS	Digital Network Architecture (DECnet)
Application	Application-specific protocols, file and record locking	NFS (network file system)	Clearinghouse (network directory)	file transfer, virtual terminals, remote resource access, down-line system load, remote command file submission
Presentation	AFP (AppleTalk filing protocol), PostScript	XDR (external data representation)	Courier (remote procedure call, remote file services)	
Session	ASP (AppleTalk session protocol), PAP, ADSP (data stream protocol)	RPC (remote procedure call)	none	task-to-task

Physical				

physically linked to the AppleTalk-based *TOPS* network by either an Ethernet/AppleTalk gateway for the Mac, or an AppleTalk add-in board for the UNIX system. You can also use Pacer's TCP/IP implementation, *pcLink*, to connect the Mac to UNIX-based TCP/IP machines.

TOPS has also introduced a software AppleTalk link to TCP/IP-based networks. Called *TOPS Terminal*, it enables Macs to communicate with all TCP/IP computers via an Ethernet card or an AppleTalk/Ethernet gateway. The program allows Mac users to connect to any number of hosts simultaneously through multiple terminal-emulation windows. The number of host connections is limited only by the Mac's available RAM; *TOPS* claims to have run more than a dozen connections at the same time on a 512K Mac. You can also edit files from UNIX machines or PCs on *TOPS*- or TCP/IP-based networks.

TOPS for UNIX also allows you to use a UNIX system, such as a Sun workstation, as a gateway. In connecting with the Sun, the Mac can communicate with any node to which the Sun is attached. Because the Sun runs a high-level networking protocol called NFS (Network File System) with TCP/IP, the Sun's connection universe is in some respects greater than the Mac's.

NFS, developed by Sun Microsystems, *TOPS*'s parent company, allows transparent remote file access on multivendor networks. NFS is now supported by more

than 132 computer companies, including DEC, Apollo Computer, Data General, and Apple.

TOPS Terminal is *TOPS*'s first step in converging *TOPS* and NFS. With NFS running directly on the Mac, the Mac will more easily access files on other NFS systems. *TOPS* expects to merge the current *TOPS* systems to NFS during the course of this year—without having to change the way users work with *TOPS*. In the meantime, another effort to bring NFS to the Mac under the Macintosh operating system is underway at the University of Michigan. That project is being done under contract for Apple.

A/UX

While the Macintosh operating system offers Ethernet connections to a variety of computers, A/UX—Apple's version of UNIX—promises to tie the Mac into even more Ethernet environments. In fact, the EtherTalk board was considered a major factor in the development of the Mac's UNIX operating system.

Included in the A/UX operating system are AppleTalk and TCP/IP protocols. So, under A/UX you'll be able to connect to both types of networks with Ethernet.

To connect to other UNIX systems via TCP/IP, you'll need the EtherTalk board, which allows you to perform file transfers and use the UNIX E-mail system. In addition A/UX also supports NFS from Sun.

NFS, however, is not the only multivendor networking environment the Mac will be involved with. The Network Computing Forum is a group of leading corporations and research centers that are focusing on

Hardware Paths

Mac Model	Product	Company	Price	Comments
Mac 512KE	FastNet	Dove Computer	\$899	Mac 512KE must have SCSI adapter; can also be connected to serial port (RS-422); equipped with 512K of RAM and 68000 processor; supports DECnet protocols with CommUnity.
	FastPath	Kinetics	\$2500	Supports Ethernet connection to any AppleTalk device; also connects entire AppleTalk LAN to Ethernet backbone; acts as AppleTalk/Ethernet bridge or gateway.
Mac Plus	EtherSC	Kinetics	\$1250	Uses SCSI port to connect Mac directly to Ethernet; supports AppleTalk and TCP/IP protocols.
	FastNet	Dove Computer	\$899	Can be connected via either SCSI or serial port; supports DECnet protocols with CommUnity.
	FastPath	Kinetics	\$2500	Supports Ethernet connection to any AppleTalk device; also connects entire AppleTalk LAN to Ethernet backbone; acts as AppleTalk/Ethernet bridge or gateway.
Mac SE	EtherPort SE	Kinetics	\$850	Add-in board for Mac SE; fully compatible with other Kinetics Ethernet controllers; supports both AppleTalk and TCP/IP protocols.
	EtherSC	Kinetics	\$1250	Uses SCSI port to directly connect Mac to Ethernet; supports AppleTalk and TCP/IP protocols.
	FastNet	Dove Computer	\$899	Can be connected via either SCSI or serial port.
	FastPath	Kinetics	\$2500	Supports Ethernet connection to any AppleTalk device; also connects entire AppleTalk LAN to Ethernet backbone; acts as AppleTalk/Ethernet bridge or gateway.
Mac II	AST-ICP	AST Research	\$999	Add-in communications board for Mac II under A/UX operating system; can act as Ethernet (TCP/IP) and AppleTalk bridge for multitasking A/UX.
	EtherLink	3Com	TBA	Add-in board for direct Ethernet access; includes AppleTalk protocol support; will include XNS support; can be used under A/UX.
	EtherTalk Interface Board	Apple Computer	\$699	Add-in board for direct Ethernet access; includes AppleTalk protocol support.
	FastNet	Dove Computer	\$899	Can be connected via either SCSI or serial port.

a new approach to computing. Apple is a member of that forum.

The approach, called *network computing*, was pioneered by Apollo Computer. Network computing allows different parts of a single application program to be distributed to computers best suited for each task. For example, the artificial intelligence portion of an application might best be run on a specific artificial intelligence workstation. That portion of the application could be automatically, and transparently, passed over the network to the AI workstation.

The goal of network computing is to take advantage of the strengths of very diverse computers—not just personal computers, but supercomputers, parallel processors, and minicomputers, all networked via Ethernet. □

See *Where to Buy* for product details.

The PostScript Difference

by Erfert Nielson

Drawing the lines between PostScript graphics applications: Cricket Draw, Illustrator, and LaserPaint compared

For Mac artists accustomed to the rough brushstrokes of bit-mapped painting programs, the transition to PostScript graphics is a quantum leap from the cave paintings of Lascaux to the fluid lines of Botticelli. PostScript graphics programs provide a direct link to a powerful programming language. At this time, three such programs are available: *Cricket Draw*, *Adobe Illustrator*, and *LaserPaint*. Others are just around the corner (see "P.S. There's More"). Each program has its own unique character, and each is appropriate for certain tasks. If you're considering buying a PostScript graphics package, the following comparison should help you decide which one meets your requirements.

These three programs have been reviewed in previous issues of *Macworld*; for a detailed description of each, see "Rounding the Bezier Curve" (*Cricket Draw*), May 1987, "Illustrator: The Tracer's Edge," June 1987, and *Reviews*, September 1987 (*LaserPaint*). For a look at each program's color-separation capabilities, see "Beyond Black and White," *Macworld*, November 1987.

Why PostScript?

PostScript is the page-description language that resides in the LaserWriter and a handful of other *raster output devices*—devices that map an image as an array of individual pixels. A page can contain a combination of text, computer-generated graphics, and scanned images, all of which can be printed on a medium-resolution device like the LaserWriter or a high-resolu-

tion device like a Linotronic phototypesetter. One of the beauties of PostScript is the fact that it's *resolution-independent*—the same image can be output at the LaserWriter's 300 dots per inch (dpi), at 1270 dpi on a Linotronic 100, or at 2540 dpi on a Linotronic 300.

In the case of the LaserWriter, the LaserPrep utility translates commands from QuickDraw, the Mac's graphics language, into PostScript. But even with a good interpreter, subtleties are often lost in translation. It's more efficient to speak to the LaserWriter in its native language, which is just what PostScript graphics programs do. These programs also provide a *front end* to versatile PostScript commands that produce effects impossible in QuickDraw, such as hairlines, compound objects made up of lines and curves, gradient fills from one gray to another, and precise rotation of text and graphics. These programs also perform a valuable service to nonprogrammers; although PostScript contains some English-like syntax, it more closely resembles FORTH. (PostScript trivia buffs might be interested to know that PostScript is so named because, like FORTH, it uses *Postfix notation*, in which operators follow operands.)

For further information on PostScript, see "Getting Started with Postscript" in the December 1987 issue of *Macworld*. Now let's look at the three programs.

JOHN HERSEY

Cricket Draw

Those accustomed to *MacDraw* or *MacDraft* should have little trouble making the transition to Cricket Software's *Cricket Draw*. The program offers familiar tools such as line, rectangle, and oval, and the methods for drawing, moving, and resizing objects are comparable to those of *MacDraw* (see Figure 1). But unlike *MacDraw*, *Cricket Draw* takes advantage of many of PostScript's capabilities. For example, you can rotate text or objects in 1-degree increments, viewing a readout of the angle of rotation as you do so. You can fill shapes with linear, logarithmic, or radial *fountains*, smooth transitions from one gray to another. While a fountain effect can be attained in *Illustrator* by layering shapes of different shades, *Cricket Draw* produces gradient fills automatically.

Cricket Draw's text-handling capabilities are impressive: the program lets you mix fonts and styles in a single block of text. In addition, a special command lets you *bind* text to a curving shape or line. In the text-effects department, *Cricket Draw* has *Illustrator* beat in many respects.

Finally, *Cricket Draw*'s *transfer modes* let you create dot or line screens for printing halftones or creating color separations. Unfortunately, this capability isn't mentioned in the manual. You have to refer to the semiannual technical notes that are sent to registered *Cricket Draw* owners, or find out for yourself by word of mouth or by accident (to access *Cricket Draw*'s transfer modes, hold down the Option key and click the object fill control box in the lower-left corner of the screen).

Why choose *Cricket Draw*? Graphic designer John Odam uses both *Cricket Draw* and *Illustrator*, and finds *Cricket Draw* more appropriate for sketches and illustrations that he wants to produce quickly. "With *Illustrator*," he says, "you must have a firm idea of what you want before drawing; *Cricket Draw* is better for freehand drawing." In Odam's opinion, "*Illustrator* is designed with the professional in mind, while *Cricket Draw* is for both professionals and amateurs." His main

complaint about *Cricket Draw* is its inability to combine lines and curves into a compound object.

Designer Michael Singleton also uses both *Illustrator* and *Cricket Draw*. He considers *Cricket Draw* an extension of *MacDraw*, with added features for graphic artists. Singleton cites *Cricket Draw*'s text capabilities and ability to display angles and coordinates as pluses over *Illustrator*, but found the program's curve-handling limited. In addition, he found little use for some of *Cricket Draw*'s tools, such as the starburst and the diamond. He finds *Cricket Draw* appropriate for projects such as organization charts and schedules, pointing out that the grate tool is excellent for creating tables and other forms with parallel lines.

I talked to several more users, and the consensus was that *Cricket Draw* is easy to learn because of its *MacDraw*-like interface, is a good choice for producing freehand drawings that include PostScript special effects, and is accessible to amateurs as well as professional artists. It is also, incidentally, cheaper than either of the other PostScript graphics programs.

P.S. There's More

If you're shopping for a PostScript graphics program, you'll soon have two more contenders to contend with. Both should be available early this year. Aldus Corporation, well known for its *PageMaker* page-layout program, plans to release a PostScript graphics program developed by Altsys. In addition, PS Publishing has announced a graphics program called *Collage*.

A preview of *Collage* at the Seybold Desktop Publishing Conference revealed a program along the lines of *Illustrator*, but with some additional features. Like *Illustrator*, *Collage* lets you create paths made up of lines and curves. A spline curve tool allows you to add or move points, offering flexible curve editing. Unlike *Illustrator*, *Collage* will let you use PostScript commands such as scale, skew, and rotate to modify a bit-mapped template once it is pasted in (this feature was not yet implemented at the

Seybold conference). Other features include a status bar that displays angles and coordinates; a snap-to grid; units of measurement including points, picas, inches, and centimeters; the ability to hide layers; and color display and printing.

Aldus's program, code-named MasterPiece at the time of this writing, will offer many of the same features as *Collage*, including a freehand drawing tool to draw or trace images; PostScript effects such as scale, skew, and rotate; rulers; a snap-to grid; layers; an information bar; color capabilities; and the ability to break a shape into its component curve segments. Special features include gradient fills; eight levels of Undo and Redo; the ability to edit a drawing in Preview mode; and clipping paths, or *friskets*. An invaluable feature allows you to make graphic style sheets and templates, maintaining consistency from one publication to the next. MasterPiece looks

strong in the area of text manipulation as well. Text attributes include binding text to a path, multiple fonts and styles in a block of text, gradient fills, and automatic or manual kerning.

Both of these programs look promising, but no matter how good a PostScript graphics program is, converting a bit-mapped image to a PostScript outline is still a time- and labor-intensive task. Wouldn't it be nice if a program could automatically trace a template for you? This wishful thinking isn't as far-fetched as it sounds. Soon we'll see *scan conversion* programs, miraculous applications that do much of the dirty work of tracing a bit-mapped image. Now, if someone would just come up with a utility that cleaned up those images and added fill patterns, all you graphic artists could simply write a few macros and then take that long-overdue vacation.

Adobe Illustrator

Illustrator is usually viewed as a program for professional artists and designers. Although some artists use *Illustrator* as a freehand drawing tool, most use it to convert images from other media into crisp, clean PostScript artwork (see Figure 2).

Generally speaking, you use *Illustrator* as follows. First, an image *template* is created and pasted into *Illustrator*. The original image can be a pen or pencil drawing converted to a bit-mapped image by a scanner, a scanned version of a photo, or artwork created with a Mac graphics program such as *SuperPaint* or *MacDraw*. The template is displayed in gray so as not to obscure the next part of the process, in

which you trace the image with *Illustrator*'s pen tool, which produces straight lines and *bezier curves*. A series of curve segments make up a *path* in *Illustrator* terminology.

Precise curve-manipulation is one of *Illustrator*'s strong points. Once you draw a path, you can reshape it by dragging *anchor points* (the points at the beginning and end of a curve) and *direction points* (points that determine the curve's shape). A path can be edited at any time; you can move or add anchor points, drag direction points, or delete segments to position the path over the template precisely. A closed path, or shape, can be filled with black, white, or a gray scale. Shapes are stacked one on top of another to build complex, multishaded illustrations.

Michael Singleton uses *Illustrator* to create maps—scanning an image, tracing it, and adding text and other details. "It's the first program that's given me the capability to produce really good-looking graphics on the LaserWriter and the Linotronic 300," he comments. Singleton praises *Illustrator*'s ability to produce two curved paths precisely parallel to one another. To accomplish this, he draws the first object with, say, a 2-point line width, copies it and pastes the copy over the original, and sets the second path to a 1-point white line. The result is two parallel ½-point-wide curves. Singleton's wish list for *Illustrator* includes a display of angles and coordinates, rulers

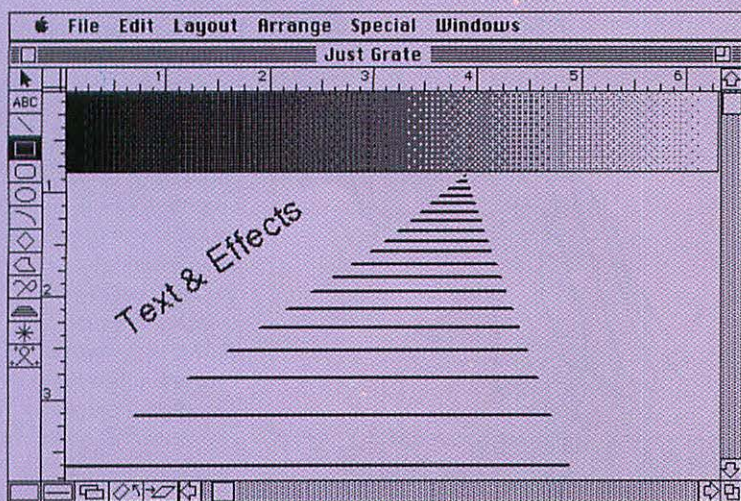

Figure 1

Cricket Draw's forte is PostScript special effects. Combine the program's drawing tools with effects such as gradient fills and rotation in 1-degree increments to create anything from a simple organization chart to an intricate illustration. The highly shaded image of a camera (right) was created by Novus Graphics, a graphic arts firm based in Monroeville, Pennsylvania.

Figure 2

Illustrator offers precise control of bezier curves. The program's ability to combine lines and curves into complex shapes, coupled with control of line weight and fill patterns, lets professional artists and illustrators take full advantage of PostScript. Jeffery West used Adobe Illustrator to create the detailed technical drawing on the left for Apple Computer.

Figure 3
LaserPaint's Drawing panel provides an array of tools, including lines, curves, and shapes. Unlike other PostScript graphics programs, LaserPaint includes word processing and bit-mapped painting modules. Hartley Healey designed the Grass Hen logo using LaserWriter percentage screens to get the screened-text effect.

not limited to picas and points, better control of layers, and the ability to edit the template.

Jeffery West finds *Illustrator* the ideal tool for technical illustrations. He converted from the traditional method of drawing on vellum with pen and ink to the clean lines of *Illustrator*. West finds that *Illustrator* doesn't drastically speed the drawing process—he still has to draw a sketch, scan it in, and trace it—but the program has other advantages that save time and avoid tedium. For example, if a drawing contains multiple versions of the same element, he can draw one element and copy it—scaling, rotating, or otherwise altering it if necessary. In addition, an *Illustrator* drawing can be easily edited. If he needs to change a line weight or a shade, he can quickly accomplish the change. If a client wishes to make changes, West can usually edit the original drawing rather than starting over. West also appreciates *Illustrator*'s ability to scale a drawing without altering line weights. His only complaint is that the Mac's screen resolution isn't accurate enough to gauge details, forcing him to print numerous proofs.

Newsletter publisher Robert Eckhardt used *Illustrator* to create the two-line title for his newsletter masthead. He had difficulty making the two lines of type the same length; text that lines up on the screen does not necessarily line up on the LaserWriter. He finally made a series of minute adjustments and printed successive proofs on the LaserWriter. He found it more efficient to do five or six experiments on a single page and then print an entire page of adjustments, rather than print one

experiment at a time. Although he initially had some difficulty learning to edit *Illustrator*'s bezier curves, once he became proficient with the program Eckhardt was pleased with the way he could use one hand for keyboard commands and the other for the mouse, without interrupting his work to select tools.

The consensus? *Illustrator* is an appropriate tool for professional artists, graphic designers, and technical illustrators. It is not as easy to learn and use as *Cricket Draw*; beginners may have trouble wrestling with bezier curves at first. But most users seem to agree that once *Illustrator* is mastered, it enables them to take advantage of most of PostScript's talents to create high-quality artwork.

LaserPaint

The newest arrival in the PostScript graphics arena is LaserWare's *LaserPaint*. This unusual program is really five mini-programs rolled into one: drawing, bit-mapped painting, text, PostScript effects, and printing specifications. Each of the program segments is housed in its own panel; click a button to move from one panel to another. We'll focus on *LaserPaint*'s PostScript capabilities, which straddle several of its panels.

LaserPaint offers many of the tools and effects found in *Cricket Draw* and *Illustrator*. The program's Drawing panel provides tools such as a curve, line, arc, circle, and rectangle, as well as fill patterns and masks. Line width is determined by a

Technical illustrator Jeffery West uses *Illustrator* to modify drawings once he has created the original images using traditional techniques.

PostScript Clip Art

It's not surprising that purveyors of computerized clip art now provide illustrations in PostScript format. In the past few months four companies have announced clip-art collections that include images created with *Cricket Draw* and *Illustrator*:

Olduvai Software, a newcomer to the Mac marketplace, offers the *Post-Art* collection, a three-disk set of images in *MacDraw*, *Cricket Draw*, and *Illustrator* format. Subject matter includes human figures, ani-

Olduvai Software

mals, and abstract designs. *Post-Art* seems to be intended more as Art than as clip art, however (each drawing is signed by the artist, which is uncommon in the generic world of mass-produced art). Most of the drawings would not be suitable for embellishing invitations, newsletters, and the like.

Studio Advertising Art offers *Click & Clip*, a collection of illustrations in *Illustrator* or EPS format. Subject areas include

seasons, borders, business, and sports. *Click & Clip* includes two disks of artwork and an image catalog for \$39.95, four disks for \$67.00, or eight disks for \$124.50.

Image Club Graphics, a Canadian company that already offers Mac clip art in *MacDraw*

Image Club Graphics

format, has announced *Digit-Art Laser Graphics Volume 3*, a five-disk set of graphics in EPS format. The set includes approximately 150 images in categories such as business, sports, entertainment, and travel, and sells for \$149.

Mac old-timers may remember that T/Maker came out with some of the first Macintosh software in 1984: a disk of *Mac-Paint* clip-art images. Their latest clip-art offering is *ClickArt EPS Images Volume I*, which includes more than 125 images in EPS (Encapsulated PostScript) format. Files saved in this format can be opened by *Illustrator* or *Cricket Draw*, as well as a number of page-layout programs. The illustrations span numerous subject areas—including entertainment, publishing, animals, and transportation—and sell for \$129.95.

T/Maker

Last, but by no means least, is a collection from Multi-Ad Services, a leading distributor of advertising art. Multi-Ad's Kwikkee Inhouse Graphics Services offers subscribers more than 75 images a month on CD ROM disks. Many of the graphics are produced with *Illustrator*. A subscription to the service costs \$200 a month, plus \$25 for each Mac workstation. In addition to providing generic graphics, Inhouse

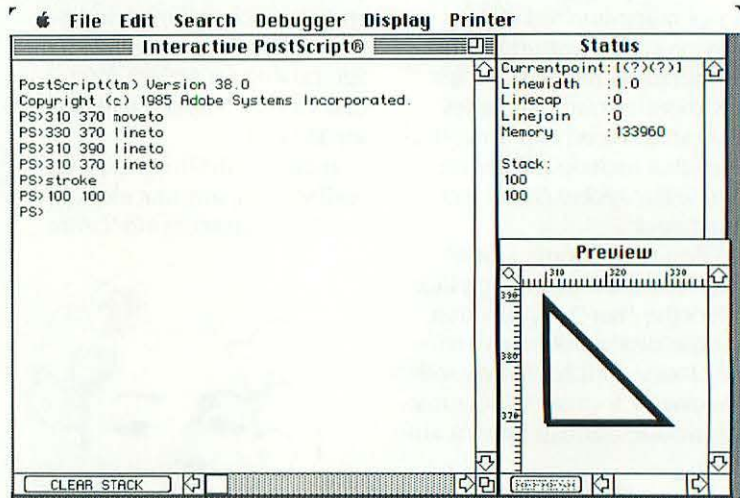

Multi-Ad Services

Graphic Services also creates custom logos and artwork with *Illustrator* for customers with specialized needs. (For more information on Multi-Ad's graphics services, see *Macworld News*, July 1987.)

Follow the Yellow Brick Code

PostScript programmers take heart! *LaserTalk*, a new PostScript development system from Emerald City Software, gives you access to the interpreter in the LaserWriter or other PostScript printers. *LaserTalk* links a Mac Plus, SE, or II to the printer's PostScript interpreter via AppleTalk; as you type commands, you see them executed in an interactive PostScript window. *LaserTalk*'s status window displays the state of PostScript variables and stacks after each line is sent to the printer. In addition, a preview window shows what will be printed, freeing you from printing proofs each time you alter your program.

LaserTalk's editor includes Undo, Search and Replace, and Clipboard support. An interactive debugger provides tracing, stepping, and breakpointing,

with line-by-line error detection and status updates. The system includes help features as well. A dictionary browser shows you all loaded dictionaries and procedures, and PostScript operators are defined with excerpts from Ad-

ison-Wesley's *PostScript Language Reference Manual*. PostScript is a bona fide programming language. It's high time it had a development system.

unique thumbwheel control, and different styles of caps and joins can be selected by clicking an icon (see Figure 3).

Enter the Goodies panel to access PostScript effects such as rotate, skew, mirror, scale, and gradient fill. So far, *LaserPaint* sounds quite similar to the other PostScript programs. Unlike the others, however, *LaserPaint*'s drawing area spans eight pages. Another of the program's strong points is its text handling. Like *Cricket Draw*, *LaserPaint* lets you bind text to a path, assign a pattern to text, and mix fonts and styles in a block of text. But *LaserPaint*'s text module is more akin to a word processor or page-layout program than to the text functions you'd expect in a graphics program. The Writing panel offers features such as multiple columns, justification, and leading and kerning adjustment.

The Writing panel also operates in conjunction with the Drawing panel's masks to fill a shape with text or wrap text around a shape.

Finally, the Laser panel includes printing features such as registration marks, trim and fold marks, and color separations. A clip option lets you print outside the normal print area.

Graphic designer Joseph Maas chose *LaserPaint* over *Illustrator* in part because of *LaserPaint*'s text-wrap and gradient-fill features. He finds the program adequate for most of his work, but claims it's awkward for precision work. He also finds it difficult to align a drawing precisely in the center of a page, with an even border all the way around.

Charles Scholdt, director of Weather Central, a weather forecasting service that provides weather maps to a number of newspapers, is another *LaserPaint* user. He chose the program because of its text-wrap and color-separation features, both of

which facilitate the production of Weather Central's maps, which were formerly produced with *MacDraw*.

Although *LaserPaint* is long on features, it's not perfect. Almost every user I talked with complained about the program's unorthodox user interface and its poor documentation. *LaserPaint* deviates from Mac interface conventions in several respects, from iconography to the way tools operate. (One unkind critic referred to "the interface from Mars.") On the other hand, most *LaserPaint* users spoke highly of LaserWare's prompt replies to questions and willingness to implement users' suggestions.

Buying Decisions

So what's the bottom line? Generally speaking, *Cricket Draw* is a good choice for those who want easy access to Post-

Script effects for freehand drawing, creating charts and forms, or adding graphic touches to ads, newsletters, and other desktop publications. *Cricket Draw*'s abilities to combine fonts and styles in a single block of text and automatically create gradient fills are not found in *Illustrator*. *Cricket Draw* has the lowest price tag and the most accessible interface of the three programs, but it lacks the ability to combine curves and straight lines into compound shapes.

Illustrator is not for the casual user. Compared to *Cricket Draw*, the program has a steep learning curve, as it were, but it offers professional artists precise control over curved shapes. *Illustrator* excels at converting scanned images into PostScript. Some artists use *Illustrator* for freehand drawing, but most find that too much planning is necessary to make the program effective for drawing from scratch. If you intend to purchase *Illustrator*, keep in mind that you'll need a scanner and possibly a paint program as well.

LaserPaint is for artists or publishers who prefer the integrated approach. Drawing, painting, text, and printing options abound, but bear in mind that you'll encounter a nonstandard interface. This program might be appropriate for those who want to work with text and graphics in the same document and don't mind learning many modules.

If you're still undecided, Table 1 will help you compare the features of the three programs. Before deciding what to buy, carefully assess which PostScript effects are essential for the graphics you want to produce. Do you want to draw freehand illustrations or convert scanned images into PostScript? Will you concentrate on illustrations, or frequently combine text and graphics? You should also consider how much time and money you're willing to invest, and whether you'll need auxiliary equipment such as a LaserWriter or a scanner. Although *Cricket Draw*, *Illustrator*, and *LaserPaint* differ in their approaches to PostScript graphics, the three programs have one thing in common: they give artists access to a programming language designed to produce art. □

See *Where to Buy* for product details.

The PostScript Lineup

Power PostScript Printing

Varityper VT600

Laser printer. **Pros:** Excellent performance and print quality; hard disk for storing fonts.

Cons: Expensive; Adobe Times and Helvetica fonts not included. **List price:** \$18,750.

Requires: 512K, AppleTalk or compatible connectors and cables.

Wow is likely to be your reaction to the performance of Varityper's VT600 laser printer, which boasts the kind of vital statistics that give desktop publishers goosebumps. It turns out ten pages per minute with 600-dots-per-inch (dpi) resolution (twice as much as most laser printers) under the direction of an Adobe Atlas controller, which contains a 68020 microprocessor running at 16 MHz, 6 megabytes of memory, and a 20MB hard disk.

A hefty 161 pounds, the VT600 outweighs the LaserWriter by 84 pounds and is about the size of a small office copier. It must be set up by a Varityper service representative, who installs the polished drum assembly that transfers toner to paper, fills the toner hopper, and prepares the print mechanism for its maiden voyage.

Interfaces and Typefaces

The VT600 contains three standard interfaces—AppleTalk, RS-232C serial, and Centronics parallel—and provides a rotary switch for choosing among them. Unlike most PostScript printers, the VT600 lacks a Diablo 630 emulation mode. That isn't important, however, when you consider this printer's typesetting bent; you'd be crazy to use a VT600 to imitate a daisy wheel.

The VT600's type drawer isn't as well stocked as some PostScript printers. The

printer's ROM contains three font families: Varitimes (a version of Times Roman), Courier, and Symbol. The hard disk holds the Aristocrat family (Varityper's rendition of Helvetica). A floppy disk is included containing screen versions of all the fonts.

This font mix presents a problem for Mac users. Because the Mac's LaserPrep file expects to find fonts named Helvetica and Times Roman, it displays an error message every time the printer is initialized, even if those fonts don't appear in the document. Worse, Aristocrat and Varitimes aren't identical matches for Adobe's Helvetica and Times, which makes it impossible to print proofs of documents destined for the VT600 on a LaserWriter.

There is a solution, but it'll cost you: Varityper sells downloadable versions of Adobe's Times and Helvetica fonts for \$190 each. The firm is negotiating with Adobe and Mergenthaler (which owns the rights to Helvetica and Times Roman) to include those fonts with the printer, but at this writing, no agreement had been reached.

Technical Wizardry

The VT600's controller was designed with performance in mind. One example is its approach to downloadable fonts. On LaserWriter-class printers, downloadable fonts are stored on a Macintosh floppy or hard disk and downloaded to the printer over the AppleTalk network. The VT600, however, can store roughly 100 downloadable fonts on its own hard disk.

Half of the VT600's hard disk is reserved for downloadable fonts. The other 10MB have been set aside as a supplement for the printer's *font cache*, an area of memory that holds the bit-mapped representations of the characters that have been printed on a page. The bigger the font cache, the faster the printer handles typographically complex documents. (For more details on how PostScript printers work, see "Laser Wars," *Macworld*, June 1987.)

When the VT600's font cache fills, the controller saves the least recently used character bit maps on the hard disk. Retrieving characters from the hard disk takes longer than retrieving them from memory, but it's faster than rebuilding them from scratch.

The end result is stunning performance. In my tests, the VT600 was at least twice as fast as the QMS PS-800 Plus, which is two to four times faster than a LaserWriter (see "Lasers at a Glance"). That's especially impressive when you consider that the VT600 must manipulate four times the amount of memory to create a single page.

And the VT600's output is beautiful. Small type is tack sharp, and you almost need a magnifying glass to see any jaggies on large text. Hairline rules are fine and delicate; at $\frac{1}{600}$ inch, they're half as wide as LaserWriter hairlines. Black areas also print beautifully, with no visible scan lines. The printer owes its sharpness in part to the fineness of its toner; one particle of it measures a scant 8 microns (eight millionths of a meter), versus the LaserWriter's 14-micron toner.

The Price of Power

While your heart will soar at the sight of the VT600's output, it will sink at its price. At \$18,750, the VT600 is the printer for the rich of us. But Varityper denies that the VT600 is a laser printer, preferring to call it a "plain paper typesetter," aimed at high-volume desktop publishers, quick-printing outlets, and newspapers. From

that point of view, it's a bargain. Its closest competitor, Linotype's 1270-dpi Linotronic 100, goes for \$32,000. For many applications, the extra cost and the hassles of working with photographic paper and chemicals aren't worth the increased resolution. —Jim Heid

See *Where to Buy* for product details.

Because the World Is Round

Dimensions 1.18

3-D design and solid-surface modeler.

Pros: Fast, easy creation and editing of 3-D images; allows simultaneous work on up to 16 windows; extensive support of high-resolution output devices. **Cons:** Documentation hard to follow. **List price:** Design Dimensions \$750 black-and-white, \$1395 color; Solid Dimensions \$395 black-and-white, \$1295 color; both programs \$2495 color; DXF Transfer \$495; demo disks \$25 black-and-white, \$39 color. **Requires:** 1MB. **Copy protection:** None.

Dimensions, from Visual Information, provides an excellent set of tools for realistically visualizing 3-D objects—complete with shading, color, and highlights. This new package consists of two separately available programs: *Design Dimensions*, which allows you to create and manipulate wire-frame, polygon-filled, and shaded 3-D representations of objects; and *Solid Dimensions*, a full-blown solid-surface modeler that uses sophisticated rendering and ray-tracing techniques to turn 3-D wire-frame representations into beautifully shaded images of solid objects.

With *Dimensions*, you can visualize objects as small as a screw or as large as a space station. It's also effective for creating the high-quality logos seen on television or for producing illustrations for advertising and technical manuals. Architects can even use *Dimensions* to produce full-color, full-perspective renderings of floor plans and elevations.

In and Out

Although *Dimensions* can produce shaded black-and-white 3-D renderings, you will best appreciate this program on a color screen. For testing both modes, I used a black-and-white Mac SE and a "full-

Lasers at a Glance

A comparison of Varityper's VT600 and QMS's PS-800 Plus. For specifications and test results of other PostScript printers, see "Laser Wars" in the June 1987 issue of Macworld.

Reviews

house" Mac II with 8 megabytes of RAM, an extended video card, a 13-inch Apple color monitor, and a 19-inch SuperMac monitor and color board.

Dimensions makes possible ultra-high resolution and precise color beyond the reproduction quality you get from the LaserWriter or the color ImageWriter II. While you can create, store, and display detailed color images with the Mac's standard printers, for the best hard copy you'll need fancier color plotters or printers. Fortunately, there are drivers that take full advantage of *Dimension's* special capabilities: creation of graphics on up to C-size paper (17 by 22 inches); of magnificent (8 1/2- by 11-inch) color prints or overhead transparencies; and of 35mm slides of 4096 by 2730 pixels, all with 16.8 million colors available.

There are numerous ways of getting data into and out of *Dimensions*. For example, an optional bidirectional DXF Transfer module imports and exports files to and from AutoCAD and other PC-based CAD systems in the DXF format. Via a process called *meshing*, *Dimensions* also creates other files that can be fed to MSC/pal, a finite element analysis program for the Mac from MacNeal Schwendler. MSC/pal performs stress and vibration analysis on 3-D designs. *Dimensions* is also PICT- and Clipboard-compatible, so the 3-D images it creates can be sent to a variety of other Mac packages, including those used for desktop publishing.

Dimensions in Depth

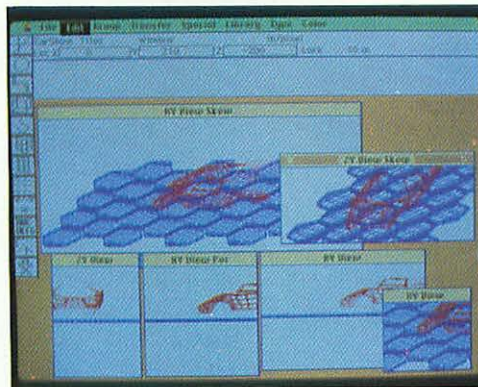

Dimensions is so rich in features and capabilities that you can't expect to master it quickly. Its extensive manual contains tutorials and explanations of concepts, but

it's hard to follow. A new version with an index and table of contents is to be issued soon. *Dimensions* also comes with tutorials in the form of helpful "slide show" files on disk. In spite of the documentation's deficiencies, I was able to do a 3-D design in my first session after running through the tutorials. Visual Information also offers training courses in which you learn the intricacies of *Dimensions* from an actual instructor.

Design Dimensions presents you with up to 16 view windows (see "Open Windows") and numerous built-in facilities for creating lines, double lines, splines (with variable tension), and free-form curved surfaces. You can key in x, y, and z coordinates as well.

You switch colors through a pull-down menu that displays color bars, each of which you can alter to match any of the 16.8 million possible colors. To do this without being overwhelmed by hundreds of color choices on the screen, you use a sliding-bar control screen to visually modify the red, green, and blue content of colors, as well as their hue, saturation, and luminance (see "Color Control").

To speed up construction of complex objects, elements can be grouped and then copied, flipped, rotated, and even colored. You can store groups as symbols and recall them for additional use on new designs.

Open Windows

With *Design Dimensions* you can open additional windows to work more easily on a 3-D design. Shown here are 6 (of a maximum of 16) open windows. As you drag the cursor from one window to the next, it automatically becomes active in that window. Each window can be made to show the design at different scales and orientations, and any window can vary in size.

Color Control

Dealing with a choice of 16.8 million colors is easy with this color-control panel, used by both *Design Dimensions* and *Solid Dimensions*. The panel permits you to independently vary a color's red, green, and blue content, as well as its hue, saturation, and luminance. The color box instantly shows you the adjusted color.

Panning and zooming are accomplished through other sets of built-in facilities.

Moving Visuals

At any time during the design process, *Design Dimensions* can rotate a 3-D image on any of its three axes. Upon command, the system creates a replay file of rotated images in wire-frame, filled-polygon, or shaded form. Playing this back later produces a poor man's "animation" of the object.

Once you are satisfied with a design, you store it and then use *Solid Dimensions* to call it up again. *Solid Dimensions* presents different multiple orthographic windows from those in *Design Dimensions*.

The *Solid Dimensions* windows incorporate a line of sight bar that allows you to position the eye location and direction of viewing in three dimensions. When you move the line of sight, the resulting perspective view appears almost instantly in a third window. And this is only the beginning. *Solid Dimensions* takes the perspective view and renders it as a full-color solid with graduated shading and highlighting. You also have a number of lighting options. And with the addition of soon-to-be-released *Combine*, *Between*, and *Animate* modules, *Dimensions* will have a real-time animation capability of ten frames per second.

The ray-traced, full-color images *Solid Dimensions* generates rival those produced on engineering workstations or mainframe-based systems. *Dimensions* puts the Mac II's speed and graphics capabilities to excellent use.—David L. Peltz

See *Where to Buy* for product details.

Freedom from the Mouse

QuickKeys 1.0

Control Panel macro utility. **Pros:** Powerful, flexible, easy to use; application-specific macros can be separate from main System set; different sets can be easily loaded from within an application. **Cons:** Quick Access application interface is confusing. **List price:** \$99.95. **Requires:** 512KE System 4.1 or higher. **Copy protection:** None.

Some Macintosh owners secretly agree with proponents of the IBM PC that a mouse is not always the most efficient tool. True, a few excellent macro programs available for the Mac offer a solution—most notably *Tempo* from Affinity Systems—but many people shy away from them because they seem too complicated. Now there's *QuickKeys* from CE Software, which simplifies defining a keystroke to perform actions normally accomplished with the mouse.

With *QuickKeys* you can easily assign ⌘-key equivalents to menu items without having to use *ResEdit*. Consequently, you can drag windows around, have text typed automatically, or scroll the contents of any window up and down, left and right, a line at a time, or a page at a time—all by using the keyboard. *QuickKeys* also lets you launch applications or documents just by hitting a single key, which means you can bypass the Finder completely.

Each System you run can have up to 100 QuickKeys installed, known collectively as the Universal set. You can also create an additional 100 QuickKeys for each application you use. When you invoke the Quick Reference QuickKey, it lists your Universal set on the screen. CE Software even provides drivers that allow you to print a template of your QuickKeys for reference positioning on your keyboard.

The utility comes with the Quick Access application for editing your keys, sample QuickKey sets, and printing templates. It also includes Init files for accessing alternative keyboards and the DialogKeys Init, for using the keyboard to click on the Open, Save, and Cancel buttons from within standard files.

Snappy Setup

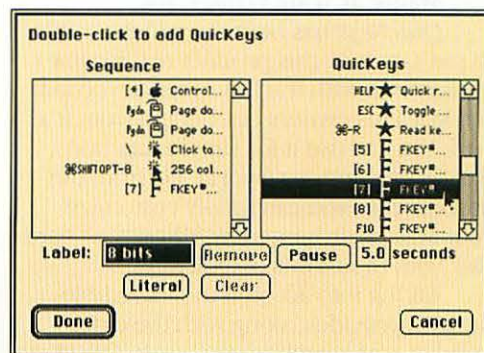

All this versatility wouldn't mean much if the program weren't easy to set up and use. Fortunately, it's a Control Panel device (cdev), so all you have to do is put the program into your System Folder. The next time you open the Control Panel (after rebooting), the *QuickKeys* icon appears along with the other cdev icons.

Once in the Control Panel, you select *QuickKeys*, and a scrollable window appears. Click on Define, and a hierarchical menu pops up with a list of available functions. Some of the choices in the Define menu, such as zooming, closing, or toggling between open windows, are programmed for you. When you select one of these functions, it is immediately highlighted in the *QuickKeys* window, ready to be assigned a key.

Some of the other functions, however, bring up more windows or dialog boxes when selected. For instance, selecting Clicks brings up a dialog box that prompts you to click on a location, then drag. After you perform the operation, you'll see another dialog box that allows further customizing. If you choose File, you can select any application or document, which will then appear in the *QuickKeys* window. After that, every time you hit the assigned key, you launch that file. If you select Menu/DA, you're asked to choose an item from the menu. Assign that item a keyboard command, and you can call it up with that keystroke.

The Power of Sequences

Sequences is a powerful function under the Define menu that allows you to group together single QuickKeys, then assign a single keystroke to the sequence. When you select sequences from the Define menu, a dialog box appears (see "Creating Sequences"). On the right are your installed QuickKeys; you construct your sequence in the empty window on the left. You can even insert a pause between two QuickKeys.

Creating Sequences

A team of QuickKeys can easily be grouped together using the Sequences function. The first key of this sequence opens the Control Panel; the next two scroll down to the Monitor cdev; the fourth selects the Monitor icon; the fifth key performs a click on 256, which changes this Mac II to 8-bit color mode; and the last is a function key that closes all open desk accessories. Merely pressing ⌘-8 runs the entire sequence.

Accessing Keys

Quick Access is a terrific *QuickKeys* application that not only lets you edit sequences but also provides complete editing control over all QuickKeys. It lets you open your Universal set—or any of your application sets—edit them, save the sets in separate files for safety and future reference, and then install them right back into *QuickKeys*. You can later open a saved *QuickKeys* file at any time (from anywhere) and temporarily use a whole other set of keys. Using Quick Access for the first time can be slightly confusing, but the excellent manual clearly explains how to use it.

Magic at Your Fingertips

QuickKeys has become indispensable to me. Granted, this product really comes into its own with the Extended keyboard, but Mac Plus owners can benefit from it as well. You can use it for simple functions, like calling up your favorite DA from the keyboard, or you can totally customize your Mac environment by filling your hard disk with thousands of QuickKeys.

Taking into account the incredible utility it provides, along with the extra goodies you get when you buy it, *QuickKeys* is a fine value. It can accomplish almost everything you want from a macro program without sacrificing power for ease of use.

—Rob Hahn

See *Where to Buy* for product details.

Heavy-Duty Design

PowerTools 1.3

Software analysis and design tools. **Pros:** Well-crafted set of professional tools; integrated to cover analysis, design, and coding processes.

Cons: Expensive; presently limited to traditional, single-task applications; inadequate manual.

List price: Complete set \$3295; individual modules: FreeFlow \$1895; PowerPDL \$995; SmartChart \$1495. **Requires:** 512K. **Copy protection:** Key disk; installs on hard disk.

Originally sold as *Prism*, *PowerTools* is a set of three integrated modules for software analysis and design: FreeFlow, PowerPDL, and SmartChart. Although the modules may be purchased separately, used by themselves they are of limited value, with the exception of FreeFlow. Together, though, this powerful trio can help you through the major stages of a software development project, from analysis to program coding.

PowerTools is as easy to use as the Mac interface, but without a hard disk it won't be as practical. Because you're likely to create large data files, the modules are inconvenient to run on floppy disks. Also, since data is kept in memory, larger projects may require 1 megabyte of memory.

Interactive Data-Flow Diagrams

Systems analysts use data-flow diagrams to analyze operational systems, illustrating how information is used and modified as it moves through the many processes of designing a system. By refining these diagrams, the analyst creates a functional model of the system, which can then be expressed as a computer program.

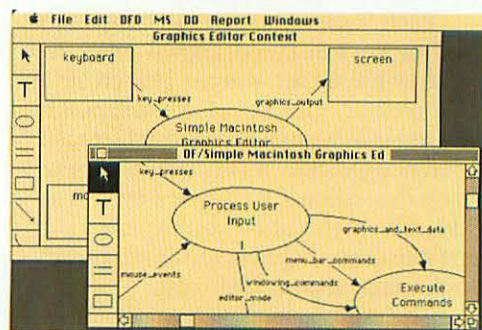

FreeFlow, the first module in the *PowerTools* series, is an interactive data-flow diagram editor. Keeping diagrams on the Mac greatly simplifies the task of creating and maintaining them (see "Free Flowing"). FreeFlow includes a data dictionary for tracking the many names of processes, flows, stores, and terminators used in a diagram. In addition, several checking functions help prevent conflicts, unattached flows, or multiple definitions.

Pseudocode and Structure Charts

Using the pseudocode editor in FreeFlow, you complete an analysis by describing its primitive processes. These "mini-specs" are then combined into a single pseudocode file, which is read by the second *PowerTools* module, PowerPDL, which

then creates additional documentation from the pseudocode as well as a special structure file for use by SmartChart, the third module.

SmartChart is a language-sensitive editor that uses the structure file created by PowerPDL to display a structure chart of the program. Using the structure chart as a navigational aid, you can quickly locate various procedures and functions within the code file and keep track of calling hierarchies (see "Charts with Smarts").

Free Flowing

The data-flow diagram shown here is the explosion of the main process from the Simple Macintosh Graphics Editor example. Data is indicated by arrows, while ovals indicate processes. The two processes in the front window may be further decomposed through a similar set of explosions.

You write the program source within the structure of the pseudocode file previously created by FreeFlow; all the pseudocode is then transformed into program comments. As long as you maintain these comments while changing the program, you can regenerate the structure chart. Keeping the chart current with the program code makes it easy to keep documentation up to date.

Managing Code and Data

FreeFlow is probably the most useful of the programs, particularly as an analysis tool. Its data dictionary and data-checking functions simplify life considerably. Unfortunately, the lack of a browse feature makes maintaining the data dictionary cumbersome.

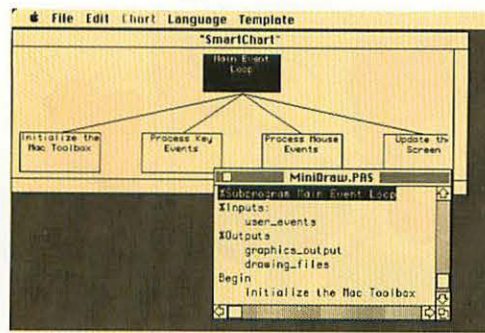

As a language-sensitive program editor, SmartChart is useful for writing code in most structured languages. A number of language-specific program structures, such as IF-THEN-ELSE or BEGIN-AGAIN forms, can be inserted into a program source by selecting them from a template menu. You can configure the editor to present templates specific to a number of popular languages, including Pascal, C, and Ada. Iconix also offers templates for other structured languages.

Although the structure-chart function of SmartChart is useful, it's limited to navigation—you can't edit or create structure charts as you can data-flow diagrams. Neither does it show the current data couples (the parameters passed) between procedures, but Iconix plans to add this feature.

To generate structure charts with SmartChart, you need PowerPDL. Without it, SmartChart is merely a language-sensitive editor. The value of SmartChart and PowerPDL lies in their combined ability to maintain the documentation of a programming project; FreeFlow, on the other hand, works well as an independent tool.

Recommended, within Limits

For experienced professional systems analysts, programmer-analysts, and software engineers working on complex software projects, *PowerTools* is an excellent design aid. Compared to similar systems running on minicomputers or mainframes, it provides comparable power at a fraction of the cost. At present, however, *PowerTools* is limited to traditional programming applications. The tools of real-time analysis, such as state-transition and control-flow diagrams, are not yet available.

Charts with Smarts

The structure chart is shown in the background, while the foreground shows the pseudocode for the corresponding subroutine. Subroutines are quickly located by double-clicking on the appropriate function box in the SmartChart window.

The manual is not easy to use, either as a tutorial or as a reference. Figuring out how to use the modules is difficult, and finding information on what the features do and how they work is even harder. In addition, the sections for each of the modules appear to have been written independently of each other, so their interrelationships are not made clear.

Finally, *PowerTools*' high price puts it beyond the range of most independent programmers working on small projects. But for professionals involved in large, complex programs involving many programmers, it is invaluable. —Ken Takara

See *Where to Buy* for product details.

A Graphics Workhorse

Canvas 1.02

Graphics program. **Pros:** Includes desk accessory version; offers high-resolution bit-map editing. **Cons:** Incomplete documentation.

List price: \$195. **Requires:** 512KE, System 4.1 or later; external drive or hard disk recommended. **Copy protection:** None.

A number of Macintosh graphics programs, such as *SuperPaint* and *GraphicWorks*, integrate the object-oriented graphics of *MacDraw* and the bit-mapped graphics of *MacPaint*. But they accomplish that by adding some *MacDraw*

features to what are basically paint programs. *Canvas*, from Deneba Systems (creator of the *MacLightning*, *Voila*, and *Memorandum* desk accessories), truly brings together these two independent worlds and adds features to both—including the option to run the program as a desk accessory.

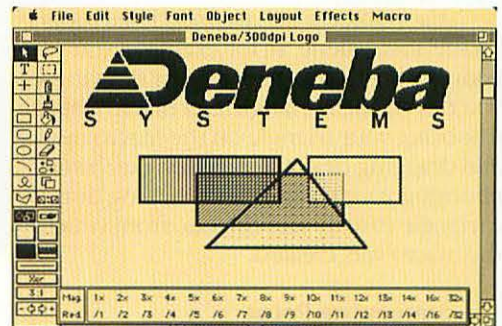

Set Up Your Easel

While most of the tools you see when you open *Canvas* are familiar to users of *MacDraw* and *MacPaint*, there are seven buttons at the bottom of the *Canvas* palette that present pop-up menus of pen and fill patterns, colors, line weights and types, transfer modes, and zoom ratios (see "Pop-up"). These menus not only display their current settings but also allow you to change settings quickly.

Unlike *SuperPaint*, which uses two separate planes for PICT and bit-mapped graphics, *Canvas* lets you work on one plane. You have the option to define an image in draw, paint, or high-resolution paint format, and can mix those formats to any degree in a single document. You can also embed PostScript commands.

After the object is created, changing its type, line and fill patterns, scale, and exact location on the page is easy. To change a rectangle to a paint object, click the check box next to Bitmap and use the pop-up menu next to it to set the resolution—from 72 dots per inch (dpi) to the LaserWriter's 300 dpi or even the Linotronic 300 Imagesetter's 2540 dpi.

To paint in a newly defined paint object, just double-click on it, and *Canvas* switches to painting mode. Inside the boundaries of the paint object, the painting tools are activated and operate at the ob-

Pop-up

With the Magnification pop-up menu, you can quickly magnify or reduce your view of an object on screen. This example shows overlapping objects with different transfer modes.

ject's resolution. *Canvas*'s almost unlimited zoom capability makes editing any paint object easy, and the ability to edit 300-dpi graphics is a boon if you use a scanner. But bit-mapped graphics have ravenous appetites—a 1-inch-square bit map at 2540 dpi takes 788K of memory—so don't expect to edit large, high-resolution bit maps unless your Mac has lots of RAM.

Objects of Admiration

Normally in drawing programs, objects obscure other objects behind them. *Canvas* gives you some control over this for each object by letting you set different transfer modes, which have different effects on overlapped objects. Say you have created a circle and a square on screen, and you've positioned the circle so part of it overlaps the square. If you specify the Copy transfer mode, the portion of the square covered by the circle will remain out of view. If, however, you specify the Or transfer mode, the undercover portion of the square will show through, as if part of the circle were transparent. The Or transfer mode achieves this effect by showing a pixel as black if it's black on the top object or black on the object underneath. Unfortunately, Apple's LaserWriter driver doesn't support transfer modes—it prints everything as opaque—so your alternatives are the ImageWriter at one extreme and the Linotronic at the other. And *Canvas*'s documentation never explains what each transfer mode does. Several pages of examples would be helpful.

Canvas even lets you define your own object types and store them as macros (dubbed *MacroObjects* by Deneba) that are added to the Macro menu. Up to 16 macros can be added to the Macro menu at one time, and they can be swapped in and out at will.

MacroObjects behave much like tools on the Tool Palette. If, for example, you commonly use triangles in your drawings, you can define a triangle as a macro object. Choosing your triangle on the Macro menu and dragging draws a triangle. Alternately, choosing your triangle and clicking draws a triangle exactly like the one from which the macro was created.

Squeezing Paint

Amazingly, Deneba has been able to cram 80 percent of the functionality of the *Canvas* application into a desk accessory version called *Canvas DA*, which comes with *Canvas* or is available separately for

\$99. Deneba claims that this DA is more powerful than most stand-alone graphics programs, and I have to agree. No longer do desktop publishers have to exit their page-layout program to make a last-minute revision to a graphic.

Canvas doesn't have all the PostScript support of, say, *Cricket Draw*, but Deneba plans to add more in future versions. They also intend to provide libraries of MacroObjects, plus direct control of most popular scanners. All things considered, *Canvas* is more than just another Macintosh graphics program.—Laurence Kirsh

See *Where to Buy* for product details.

Come On, Let's Go

Go for the Macintosh

Board game simulation. **Pros:** Decent level of play; great flexibility in setup and display; superior introduction for beginners. **Cons:** Playing is addictive. **List price:** \$39.95. **Requires:** 512K, 800K disk space. **Copy protection:** None.

Go, the 4000-year-old national game of Japan, is an extremely refined and aesthetically pleasing pastime. The rules are simple—anyone can learn to play at a recreational level in ten minutes—but devising good strategy is far subtler than in master-level chess. Go inspires a different view of conflict, since

playing develops a complex pattern, rather than an increasingly empty board.

The Tao of Go

It's a triumph that computer Go even exists—as late as the middle 1970s anything but beginner's play by a computer was thought to be impossible. Unlike in chess, the Go board fills up, forcing the computer to study the details of increasingly large and complex patterns. Even hundredfold speed increases in conventional computer architecture won't let machines play Go at a strategic, master level. Because of this complexity, the First International Computer Go Tournament wasn't held until 1986, nearly 20 years after the appearance of the first competent computer chess games. *Go for the Macintosh* from Infinity Software placed first for microcomputer entrants in the tournament and fifth overall.

Go is an excellent match for Mac graphics, which give the computer game a nicely realistic look, as opponents alternately place black and white stones on a square grid (see "Masters at Play"). The aim of the game is to capture territory by enclosing it within a line of stones. Although stones can be captured and removed from the board during small battles,

Masters at Play

Go lets players choose a 3-D view of the board and rotate it to "study the angles." This figure shows the middle stage of a classic game between two of the best Japanese players, annotated at left by the program.

the result of a Go game is typically a complicated, beautiful arrangement of stones on a nearly filled board.

Picking Up the Moves

Go for the Macintosh provides an excellent way to learn the game and proves a talented and forgiving opponent. The pro-

gram includes a tutorial managed by the hypertext program *Mini-Guide*, which lets you step through examples and beginner's practice games interactively. The tutorial is based on the American Go Association's standout text *The Way to Go*, which is the clearest exposition on the game yet produced.

Go can also annotate the computer's moves during a game. The program lets you take moves back and give yourself handicap stones. The board adjusts from the standard 19-by-19-line grid to a smaller 9-by-9 or 13-by-13 grid for faster games (a 9-by-9 game takes about eight minutes). This feature helps you practice tactics on a small scale.

Higher Levels

If you already play Go, you will find *Go for the Macintosh* more patient and probably more capable than most of your human opponents. Although no program is likely to play *dan-level* Go (the highest master level in Japan) anytime soon, this program can take on good players at a university Go club. You also can change the computer settings for the number of moves played ahead, making play more difficult; you can change the relative weights for stone capture versus territorial moves; and you can set 20 or so parameters that direct strategy and tactics. In effect, you can improve your game by putting more pressure on your particular weaknesses.

Go lacks long-range strategic sense, but the program is adept enough in small battles to keep you quite busy. Also, on the 9-by-9 and 13-by-13 grids, where the number of possible moves is much smaller, the program can seriously challenge strong

players. And of course, if you are one of the few Americans with 5-dan amateur status, you can always give the program a few handicap stones to make things more exciting.

This program is a masterpiece and one of the best recreational software bargains around.—Charles Seiter

See *Where to Buy* for product details.

A Tutor for Freshman Physics

Physics

Introductory science tutorial. **Pros:** Brilliantly animated illustrations of many basic principles of physics; interactive quiz mode; coordinated with standard text material. **Cons:** Weak spots in material; a few problems with Problem mode. **List price:** \$99.95. **Requires:** 512K. **Copy protection:** Key disk.

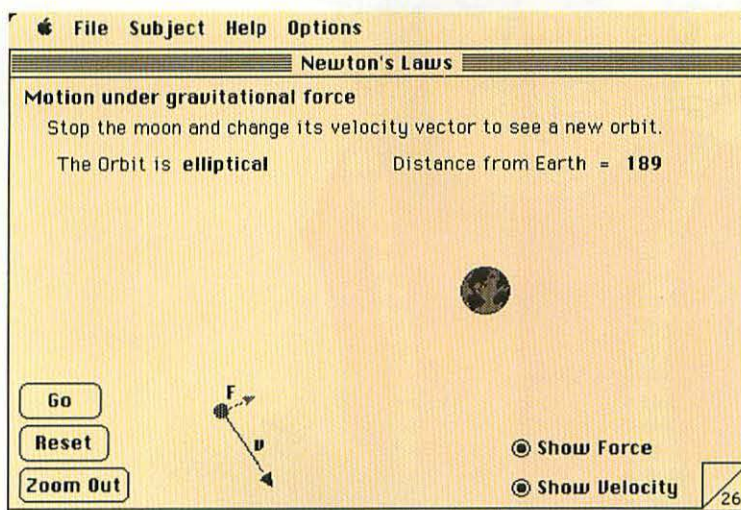

Physics is a subject that presents unique teaching difficulties. Progress depends on insight in applying mathematics, which students often have a somewhat shaky background in. So there are two challenges: a given physical situation must be presented in a meaningful way, and the related math must be made simple and clear. The first challenge usually calls for pictures, the second for ingenuity. *Physics*, from Sensei Software, shows

plenty of both. It is the most effective physics tutorial available, with the possible exception of some experimental systems elaborated by physics departments at large universities. *Physics*' developers have successfully attacked formidable pedagogical problems and created a product that is both entertaining enough to appeal to the intellectually curious and a boon for science students at all levels.

Around the World in 80 Seconds

Physics follows this format: an animation of a diagram from a standard physics text is followed by a selection of interactive problems for drill in the basics of physics calculations. Despite the innovative features of the program, it is well connected to standard teaching practice, and it's easy to match up textbook problems with those in the software. Although you might want to work through *Physics* chapter by chapter, the program's index moves you immediately into any of the several hundred topics available.

"In Orbit" shows a typical animation: the force and velocity vectors for a moon in orbit. You can change orbit starting conditions (the direction and magnitude of the velocity vector) and even send the hapless satellite hurtling off into deep space, if you like. Diagrams frequently have italicized "hypertext" terms which, when clicked on, show a highlighted part of the diagram. In many examples, a button for calling up a calculus-based description of the diagrammed situation is also provided. The animation is then usually followed by several sample problems, which can be solved

In Orbit

The animated textbook illustrations in *Physics* can be easily matched with static examples from a textbook, but they convey an amazing amount of information simply by moving. This example imparts a feeling for the delicate balance of forces required for a stable orbit.

using a pop-up scientific calculator. Problem solving is facilitated by several options; the program may refer you to sections of text for help, and it features a Hint button in many difficult cases.

Problems 2.1 and 2.2

The first five chapters of the program are the best introduction to mechanics you are likely to find. Since this material represents the first third of a one-year physics course, it's crucial. *Physics* is just the thing for building students' confidence and clarifying basic concepts. The chapters on electricity and magnetism are also very good.

It's not clear whether the developers ran out of energy or just disk space, but the material on thermodynamics and on waves is weak. Perhaps the market doesn't justify expanding this program into *Physics I* and *Physics II*, but it would be valuable from a teaching viewpoint to enhance these sections and add a few more.

The Problem mode also has a modest design shortcoming. Despite admirable effort in the text to impart the idea of significant figures in a calculation, the program simply signals *Incorrect* if you enter a typical unrounded calculator answer in a problem. This may confuse students, especially when they have set up the solution correctly, and there should be a separate flag to specify *Incorrect—too many digits in answer*.

These are mild caveats about a program that does an excellent job overall. This approach could be extended to any part of the science and engineering curriculum. Sensei has developed a similar program for geometry and is preparing one for calculus. It would be good news for education if Sensei extended the format through differential equations and beyond. —Charles Seiter

See *Where to Buy* for product details.

It Won't Necessarily Get the Job

ResuméWriter (Personal Version) 1.0

Resumé-writing aid. **Pros:** Automatic reformatting; ease of use. **Cons:** Lack of format flexibility; limitations on entry size; can't see whole document while writing. **List price:** Personal Version \$100, Student Version \$30.00.

Requires: 512K. **Copy protection:** Initialized to user.

I've been writing résumés professionally for many years and doing it on the Mac since 1984. With as many as ten résumés a week flowing through my office, I'm always interested in anything that makes my life easier.

ResuméWriter, from Bootware Software, lets you switch among three formats (actually four formats, but two are very similar) and does all the layout chores itself. And it's a good tool to help clarify one's history and goals—particularly for someone with a fairly traditional work history. A résumé generated with this package will help get you started, but *ResuméWriter* won't save a résumé weakened by passive language, lack of focus, or wordiness.

Preparing Your Résumé

As with many database programs, information is entered on a series of screens. To enter a job, for example, you fill in the company name, address, and phone number. The next screen allows a few lines to describe the company. And the screen after that prompts you for your job title, job description, and starting and ending dates.

Each screen is fully editable, and when you're preparing different versions of a résumé you can choose whether to include or exclude a screen. However, you can't exceed the space the program allows for each entry (for a job description, it's only about 3½ lines in 12-point Chicago). And because the text-entry box cannot be filled completely, you think there's still a line and a half to go when it runs out of room.

For creating a custom version of your résumé, you may include or ignore any screen, but you can't choose between fields in the same entry screen. You can, however, define your own category headings, which is a nice feature.

All content editing is done at the screen level. When viewing the whole résumé, you can change formats, select fonts, and add visual garnishes, but you can't change any of the information you've entered. This means that as you edit, you can neither see the complete entry for a job, nor the total product. But it's easy enough to go back to any of the data-entry screens and change details.

The Program's Assumptions

ResuméWriter makes some questionable assumptions about how résumés should be written. It asks for irrelevant information, such as the complete address of all employers, and allows as much room for a company description as a job description. While you can work around these limitations, it would be easy for the inexperienced to bury crucial information under trivia.

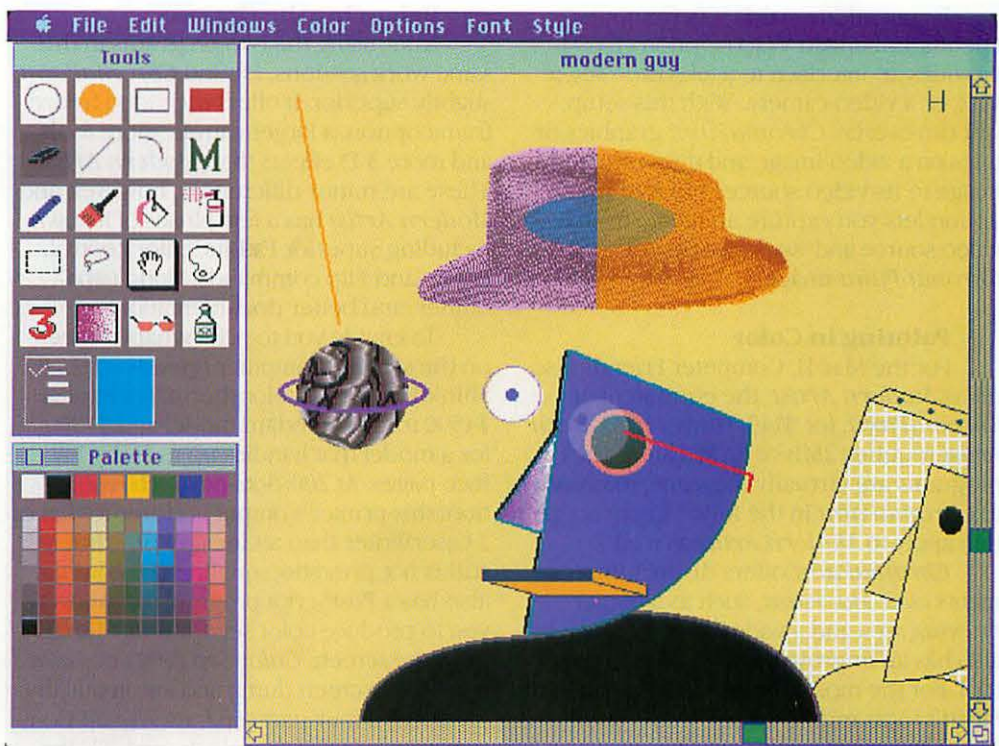

The program provides three basic formats: two columns; one column with left-justified section heads and indented text; and one column with centered heads or a combination of centered and left-justified section heads. It does not support the popular bulleted format; all entries must be in paragraph form. And it limits you to nine job entries and three education entries.

ResuméWriter's formats work well enough for those with typical work histories. But for others it's not flexible enough. I use over a dozen résumé formats, depending on what makes the client look best.

Perhaps *ResuméWriter's* problem is its perceived niche in the market. While it's not a good choice for the novice writer working on a personal résumé, it would clearly work in classrooms, and as one of several tools for professional résumé writers.

Bootware plans to add the capabilities to edit paragraphs in the Display Resume mode (thus allowing bullets), to create multipage curriculum vitae, and to export files to popular word processors. So the program may yet grow from a useful clarification tool into a serious résumé writer. —Shel Horowitz

See *Where to Buy* for product details.

The Modern Guy

Several of Modern Artist's features appear in this picture created with the program. The hat is a scanned image imported and colorized. The planet is a gray-scale image also imported, and the mouth is a 3-D box from the rectangle tool.

Chromatic Options

SuperChroma

Add-on hardware and software color system. **Pros:** Easy-to-master MacPaint-like interface; video freeze-frame option for capturing TV images. **Cons:** Expensive; screen flickers; low resolution; slow at times. **List price:** SuperChroma with ChromaPaint \$1500; Enhanced Video Option \$1500; Sony Trinitron 12-inch monitor \$650. **Requires:** 512K, 800K disk space. **Copy protection:** None.

Modern Artist

Color paint program for the Mac II. **Pros:** First color paint program available; easy-to-use interface. **Cons:** No video freeze-frame option; low resolution. **List price:** \$199. **Requires:** Mac II. **Copy protection:** None.

Long before the arrival of the Mac II, Computer Friends offered color on the Mac. With the SuperChroma system, comprising a display graphics controller, a color monitor, and *ChromaPaint* software, you can paint in color on a Mac

512K, a Plus, or an SE. Color illustrations can be created with *ChromaPaint's* MacPaint-like drawing tools, and images from MacPaint and other graphics programs can be imported to *ChromaPaint* and colorized.

The basic SuperChroma system—graphics controller, monitor, and *ChromaPaint*—sells for \$2000. It requires no modifications to your Mac, and it's connected by a cable to the modem port.

With the Mac II now available, SuperChroma may seem an expensive way to add color, especially when you consider that it runs only *ChromaPaint*—no other Mac programs, color or otherwise, can appear on the color monitor. It also uses both screens at once: the Mac screen displays the menu bar while the SuperChroma monitor works as the paint canvas (which is four times the size of a MacPaint canvas). But SuperChroma offers two advantages: it adds color capabilities to Macs not designed for color; and it provides a link to NTSC video, the U.S. standard for television signals.

For an additional \$1500, Computer Friends' Enhanced Video Option (EVO) provides an interface to a television set, a VCR, or a video camera. With this setup, you can overlay *ChromaPaint* graphics or titles on a video image and then return the image to its video source. A freeze-frame option lets you capture an image from a video source and work with it as a *ChromaPaint* image.

Painting in Color

For the Mac II, Computer Friends also offers *Modern Artist*, the equivalent of *ChromaPaint*, for \$149. However, *Modern Artist* requires 2MB of RAM. (Since the two programs are virtually the same, references to *ChromaPaint* in the following description apply to *Modern Artist* as well.)

ChromaPaint offers distinct improvements over *MacPaint*, such as a bigger drawing area and a wider array of tools. It also has an improved spray can and an arc tool. For the most part, however, *ChromaPaint*'s tools mimic those of *MacPaint*. The feature that really sets *ChromaPaint* apart is, of course, color. You can use as many as 96 colors simultaneously from a palette of 256, and you can adjust colors for hue, tint, saturation, or intensity in either the palette or the drawing area.

ChromaPaint's other notable advantage over *MacPaint* is the addition of 3-D effects. Although primitive when compared to those of 3-D CAD programs, such as *Mac3D* or *Pro3D*, they provide a way to automatically add three-dimensional shading to objects in an illustration. You use the 3-D tool in conjunction with the filled rectangle tool to create cubes, or with the filled circle to produce shaded spheres. The tool not only shades objects but allows you to choose a light source before rendering them. Other interesting shading effects are possible; for example, using the 3-D tool with the selection rectangle produces a rectangle with a continuous shading between two colors.

ChromaPaint has an annoying screen flicker caused by a problem with the NTSC signal. You can work around it to a degree, but not entirely. Both programs are extremely slow at times; more than once I thought they had frozen. But on the whole, *ChromaPaint* seemed bug-free, and the minor problems I experienced with *Modern Artist* probably occurred because I was working with a prerelease version.

Balancing the Options

After using the two programs in the same work sessions, I found *ChromaPaint* slightly superior. It offers the video freeze-frame option, a larger canvas, more tools, and more 3-D effects than *Modern Artist*. These are minor differences, however, and *Modern Artist* has a few pluses of its own, including superior FatBits, color control, Rotate and Flip commands, Undo capabilities, and better documentation.

To enable you to print what you see on the screen, Computer Friends offers the Shinko CHC-335 color thermal printer at \$4590 for the standard model and \$7800 for a model that handles up to 11- by 14-inch pages. At 200-dots-per-inch resolution, this printer's output is closer to that of a LaserWriter than an ImageWriter, but it still is not printshop quality. The company also has a PostScript program that allows you to produce color separations directly from the screen. *Color Sep* (\$99) makes a PostScript screen dump and automatically produces a four-part separation. And Computer Friends' \$599 genlock card, TV Producer, makes the Mac II's video card compatible with NTSC signals, so you can overlay live video with graphics and titles.

The SuperChroma system offers NTSC compatibility, but it is an expensive way to add color capability to the Mac. *Modern Artist*, on the other hand, is a good product at a reasonable price.—*Scott Beamer*

See *Where to Buy* for product details.

This Base Is Loaded

1stDesk 3.5

Relational database system. **Pros:** Good report generation and mail-merge capabilities; built-in telecommunications software; can scan a MacPaint form to create a data file design.

Cons: Documentation poorly organized and hard to use. **List price:** Four-module system \$195; multiuser version 4.0 \$295; demo version (10 records) free. **Requires:** 128K. **Copy protection:** None.

1stDesk is a relational database system that does more than just keep track of data. An enhanced version of *1stBase*, one of the first databases for the Macintosh, *1stDesk* consists of four program modules: *1stFile*, *1stScan*,

1stMerge, and *1stPort*. The program handles large records and files and has an array of powerful, advanced features, such as the ability to convert data between file formats; to generate sophisticated, attractive reports; and to merge print forms, labels, and envelopes.

Four of a Kind

Although it's in the same class as *Omnis*, *Helix*, and *Reflex*, easy-to-use file design sets *1stFile* apart (see "Blueprinting"). Data entry is also simple; you just choose Add Records from the Forms menu to display a blank data entry form. *1stFile*'s relational capability lets you combine several files into one (the files must share one field that has the same type and length). Reports are easy to design and can include macros for calculating new information. Printed reports are restricted to one font, but can be exported to *MacWrite* for more elaborate formatting.

1stScan uses a simple method to create a database blueprint and a custom data-

entry screen: it scans a *MacPaint* image of a form (either drawn or scanned with a digitizer) and creates a blueprint for the data file based on underlined spaces and blanks. In 90 seconds an exact duplicate of the form appears on the screen, ready to use for database entry. The program lets you scan different fonts, type styles, and even graphics. Adding information to a new data file is as simple as filling in a form, so virtually no training is needed to get started.

1stMerge is a powerful, flexible mail-merge utility designed to work with 1stFile data files and *MacWrite* (and other word processors that accept *MacWrite*-format files, such as *Microsoft Word 3.0*). Unlike other print-merge programs, 1stMerge does not require you to save data in a special format. You simply set up a form letter in *MacWrite*, enclosing field names in brackets, then return to 1stMerge to print. The Scan/Don't Merge feature lets you preview your form letter before printing to make sure field names and brackets are entered correctly. Sample *MacWrite* documents are included for printing envelopes and mailing labels, up to five across a page—a feature most other mail-management programs don't provide.

1stPort is a data-transport and file-conversion utility that allows you to change text and data files from 1stFile, DIF, SYLK, and flat-file formats to any other format. You don't have to convert a file initially to 1stFile format; 1stPort can, for example, convert a *Multiplan* file to 1-2-3. The program supports telecommunications for modem and hard-wire links (up to 9600 baud). It also includes a text editor, so you can remove control characters and other

garbage from files that have been received and adjust column boundaries to display data more attractively.

The Minus Side

1stDesk has some shortcomings. It deviates from the Mac interface in small ways. For example, to save a report design you select Save from the Report menu rather than from the File menu. Another minor inconvenience is that data file searches start at the displayed record, not at the beginning of the file, so before initiating a search, you must return to the first record.

1stDesk has been upgraded several times. Reports designed using earlier versions of the program are incompatible with later versions. To upgrade a report, you must re-create the design by either copying the old instructions manually or capturing them via screen dumps one screen at a time—an inconvenient procedure.

Context-sensitive help is available online, but often you must refer to the lengthy, poorly composed manual. Though the manual's tutorial sections are well written and illustrated, references are difficult to find. Many pages are not numbered, there is no table of contents, and the indexes are buried in the body of the manual.

Although the manual is disappointing, the program is excellent. Overall, *1stDesk* is a capable database manager with simple file design, powerful mail management, and sophisticated file-conversion capabilities. Be sure to look at the free demonstration disk before you buy this database manager.—*Nanci Hamilton*

See *Where to Buy* for product details.

Blueprinting

Before you can enter data, you define the fields that make up each record. 1st Desk's 1stFile module recognizes two types of fields: text and numeric. Field length is set by clicking within the Format box and typing characters. To modify an existing Blueprint, open the data file you wish to alter and select Change Blueprint from the File menu.

A Concert in PostScript

Concertware+MIDI 4.00

Music notation program. **Pros:** Ease of use; fast conversion of MIDI input to notation; formatting flexibility; compatibility with Sonata (PostScript music font); lyrics automatically adjust spacing on reformatting. **Cons:** Some symbols missing or overly difficult to enter; only eight staves per system; no part-extraction capability; no way to tighten up spacing; difficult to override automatic transcription. **List price:** \$149.95; \$25 upgrade from Concertware+MIDI; \$70 upgrade from Concertware+. **Requires:** 512K. **Copy protection:** None.

Great Wave software's latest version of *Concertware+MIDI* is the first commercial program to let you print music played in real time (as opposed to step time or note-by-note) with Adobe Systems' revolutionary PostScript music font, Sonata. As in the earlier versions, the package consists of three applications and a collection of sample files, MIDI setups (for popular synthesizers), and instruments (for the Mac's speaker).

Inventory

Great Wave changed the Instrument Maker and MIDI Player portions of the program by grouping all instruments into a single library accessible by the three applications. The MIDI Player now has additional features: a volume control, displayed tempo changes ranging from 30 to 225 beats per minute, MIDI setup data, and synchronization to an external device via MIDI Sync. An interesting innovation is the ability to synchronize Macintosh-synthesized music to the external MIDI device as well.

Quantization

Concertware+MIDI 4.00 implements a new form of quantization upon input. Users specify an arbitrary set of note durations and rest values to which all MIDI input will be "rounded off."

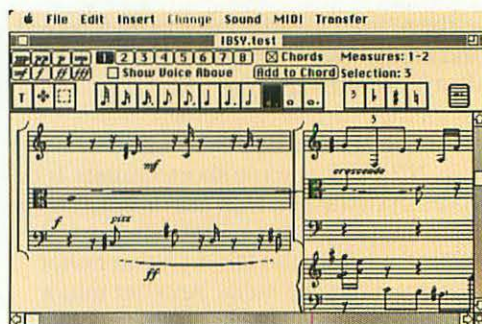

Most of *Concertware+MIDI*'s new features are implemented in the Music Writer application. Music played on any MIDI keyboard in real or step time may be auditioned, rerecorded, or inserted directly into a score. Cut, Paste, Copy, Search, and other functions are easy to execute. For inputting from a MIDI keyboard, the new version adds the option of placing the symbol palette at the top of the screen. If you don't have a MIDI keyboard, you can input notes with the mouse or play them in real time on the Mac keyboard.

The speed with which *Concertware+MIDI* 4.00 converts MIDI data into conventional music notation is unparalleled, due in part to the software's ability to quantize upon input. In most MIDI sequencers, quantization is applied after a performance has been recorded. *Concertware+MIDI* 4.00 lets you preselect a set of rhythmic values; the program then rounds off all MIDI-supplied rhythmic data to match the nearest preset note values (see "Quantization").

Whereas earlier versions of *Concertware+* allowed only eight monophonic (single-note) melodies to appear on two staves, version 4.00 permits eight polyphonic (multiple-note) melodies, each with up to eight simultaneous notes, to be notated on up to eight staves. After entry, you can isolate any grouping of notes from chords, making quick work of delineating the melody or bass line. Furthermore, the developers have solved a problem that has plagued sequencer/notation packages from the beginning: individual parts may now jump from staff to staff at any point.

Concertware+MIDI's formatting options allow you to insert a ruler at any point (see "Formatting"). These rulers give you complete control over the spacing between staves and systems; over page, measure, and line breaks; and over brackets, braces, and clefs. These rulers also give you access to a number of powerful musical parameters. They allow you to determine the number of staves that are displayed and/or printed, to assign parts to particular staves, and to place dynamic (loudness) markings in the score.

Of course the best news is that *Concertware+MIDI* prints with Adobe's PostScript music font, Sonata. Because this font is not a bit-mapped character set, the output from a LaserWriter or other PostScript

Formatting

Rulers analogous to those used in MacWrite give you complete control over spacing between various elements and over the assignment of parts to a particular staff.

printer is much closer to publication quality than before, and ImageWriter printing is also vastly improved. (However, Sonata doesn't allow slanted beaming.) Although Great Wave supplies the screen fonts needed for Sonata, to download the actual font to your LaserWriter you must purchase the \$95 downloadable version from Adobe—otherwise the printer merely creates a bit-mapped version of the screen fonts.

Elegant Additions

For the more sophisticated user, version 4.00 offers MIDI Synchronization options that either "slave" the program to an external device (such as a sequencer or drum machine) or vice versa. While it has no SMPTE (Society of Motion Picture and Television Engineers) timecode lockup features, *Concertware+MIDI*'s sync capabilities are fully functional and provide a great introduction to synchronization.

Concertware+MIDI handles text similarly to Mark of the Unicorn's *Professional Composer*: by using the Tab key instead of the spacebar, you can permanently attach words and syllables to specific notes. In this way lyrics automatically accompany the appropriate notes, despite changes to the score.

Educators or authors who want to combine musical examples with text can use the selection box to copy any portion of the screen and transfer it to a word processor. *Concertware+* files may also be saved as *MacPaint* documents for further polishing.

For the money, *Concertware+MIDI* 4.00 is the easiest way to output printed music to a PostScript printer. In spite of its superior printing capabilities, the program does have a few significant drawbacks. The eight-stave limitation may pose some problems, particularly for orchestral composers. Others will be dismayed to hear that the part-extraction capabilities found in earlier versions of the program, rudimentary as they were, have been removed. Some basic symbols such as crescendo and diminuendo are missing. Although you can add such performance instructions through the text option, you must invoke the program's esoteric MIDI Macro options to make MIDI instruments respond to these expressive markings. Because key signatures are global, you will have to take extra steps when you use a synthesizer to preview a score that is to be played on transposing instruments.

While not as robust in features as some of the more expensive professional music notation packages, *Concertware+MIDI* version 4.00 should be the choice for first-time MIDI musicians and anyone who needs quick-printed PostScript output from music played in real

time. Deeper in the program are powerful tools that can satisfy intermediate to advanced users as well.

—Christopher Yavelow

See *Where to Buy* for product details.

Piece of Mind

Subli-Mac 2.0

Self-help program. **Pros:** Easy to use; encourages relaxation and positive thinking.

Cons: Hard-to-read manual lacks useful examples and makes many unsubstantiated claims; animation and subliminal displays are erratic. **List price:** \$39.95. **Requires:** 512K. **Copy protection:** None.

Mac-ESP 1.4

Self-help program. **Pros:** Easy to use; encourages relaxation and concentration.

Cons: Hard-to-read manual makes many unsubstantiated claims; lack of random selection makes objective testing difficult. **List price:** \$49.95. **Requires:** 512K. **Copy protection:** None.

Remember the scandal when moviegoers of the fifties discovered that many films contained messages (You want popcorn) that flashed on the screen so fast they were invisible to the conscious mind? Remember the talk about how those messages went straight to your subconscious (Buy popcorn!), influencing your behavior without your knowledge? Well, they're back.

A new program from Psy-Den America Corporation, called *Subli-Mac*, promises to harness the power of subliminal messages to help you change your habits, develop new skills, and generally become the person you've always wanted to be. This time around, you can write the messages that you view subliminally. Once they're composed, you can save them and reprogram yourself as often as you like.

According to the manual, subliminal programming works best if you achieve a relaxed alpha state. To help you get there, *Subli-Mac* displays a series of colors on your screen that leads you from active red to calm indigo. The million Mac owners

The Hypnotist

One of many sets of Subli-Mac eyes watches you while your subliminal messages flash on the screen.

who don't have color monitors are advised to use colored cards or visualize colored images, by thinking, for example, "I am totally surrounded by red. I see tomatoes."

Once you're alpha-betized, you meditate on a hypnotic pair of eyes, set in a partial face bearing a flashing "third eye" on its forehead (see "The Hypnotist"). You choose among several sets of eyes or geometric patterns. Whatever you focus on, you become aware of your messages briefly flashing at regular intervals. Just ignore them; they're talking to your subconscious, not to you.

The Ridiculous to the Subliminal

Can regular sessions with this program over an extended period of time really change your behavior? Maybe. Could you achieve the same results by regularly meditating on a handwritten or memorized affirmation? Probably. It would take an expensive, carefully controlled study to determine whether there's any advantage to subliminally programming yourself with *Subli-Mac*.

If you're more inclined to put your research dollars into extrasensory perception, you can try *Mac-ESP*, also from Psy-Den. You have to go into an alpha state first, using the same colorful techniques as you would with *Subli-Mac*. Once you're there, you bring up a screen with cards containing either the geometric shapes of the classic Zenner cards or descriptions of images of people and places. Choose one, click on it, and concentrate on the full-size image that appears on the screen. Then try to send a mental picture to someone across the room (or across town). Every few seconds the image on the screen inverts briefly to remind you to concentrate; otherwise, it behaves like an ordinary playing card.

For scientific ESP study, a physical deck of cards might be better; it would allow for *random* selection of images, eliminating the possibility of the receiver second-guessing the sender's preferences. (The developer claims that random selection was intentionally left out because telepathy works better if the sender has freedom of choice; skeptics say intuition is not telepathy.)

Read My Mind

In case you haven't sensed it by now, I have a problem with these packages: hype. The company's ads, manuals, and online documentation are full of outrageous claims about how these programs can change your life or your business; they're virtually devoid of concrete references for anyone who's interested in seriously studying consciousness. I'd find it a lot easier to like these programs if they were marketed as entertainment packages or if they provided more references and examples to convince skeptics that they really work.

Personal computers have many positive applications in the arena of human potential; for example, they're widely used with biofeedback devices to help control stress. But I'm not convinced that *Subli-Mac* and *Mac-ESP* do anything that can't be done as well without a computer. Unless you're a collector of New Age paraphernalia or high-tech oddities, I recommend you spend your personal-growth budget on books, cassettes, or a workshop, instead of these programs. —George Beekman

See *Where to Buy* for product details.

Getting on the Bus

GPIB-SE

IEEE-488 instrument controller/coprocessor board for the SE. **Pros:** Well-engineered controller for popular instrumentation bus; 68881 coprocessor and DMA options available; outstanding technical support. **Cons:** Inadequate documentation. **List price:** Controller board \$495; DMA option \$300; 68881 option \$500. **Requires:** Macintosh SE.

The single slot in the Macintosh SE and the wide-open architecture of the Mac II have relieved the problems of data acquisition and interfacing to scientific instruments. On older Macs the process required awkwardly kludged clip-

on boards or serial-port schemes. While the Mac II is perhaps a more obvious choice for add-on board development (National Instruments has several Mac II cards), the SE's small footprint and lower price make it attractive for actual lab use. Since the SE has only one card slot, however, manufacturers of SE interfaces must provide all likely options—such as math coprocessors—on their boards.

National Instruments has solved that problem with its multifunction SE card, which interfaces with instruments designed for the General Purpose Instruments Bus (GPIB), defined by ANSI/IEEE Standard 488-1978. The GPIB has been widely adopted for scientific instruments, including testing and measurement equipment. The convenient and well-documented interface has a data-transmission rate of up to 1 megabyte per second, making the GPIB-SE worth considering for nearly anyone who uses laboratory instrumentation.

Hooking It Up

Although the GPIB-SE can be installed by anyone with a Torx screwdriver and a modest amount of courage, only installation by an Apple dealer will preserve the SE warranty. National Instruments provides diagnostic software to check on the installation. Installation simply involves sliding the board into place and connecting the GPIB port to the SE's back panel.

A *LightspeedC* language interface is provided with the GPIB-SE, ensuring an economical route to data acquisition. For larger lab budgets, National's *LabVIEW* programming system (\$1995) supplies an easy-to-use interface. Using *LabVIEW*, it took three hours to set up data acquisition from a Hewlett-Packard 1090 liquid chromatography system.

LabVIEW provides a prepackaged initialization screen (see "SE How They Run") for the GPIB-SE as a virtual (user-definable, software-based) instrument and offers a special set of program icons for managing communications on the IEEE-488 bus (see "Boxes, Little Boxes"). It also offers "canned" interfaces for a long list of standard laboratory instruments. For instruments on this growing list, all interface details are automatically handled when you select the virtual instrument corresponding to the lab hardware.

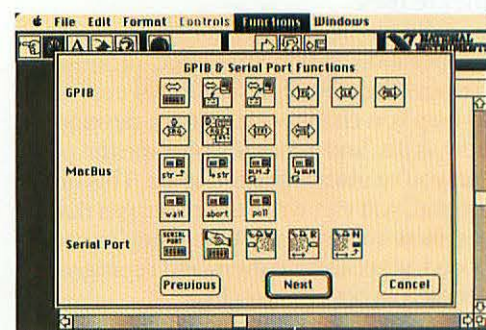

SE How They Run

Under *LabVIEW*, the GPIB-SE board has its own start-up screen on disk. The user either calls up a prepared virtual instrument corresponding to the items of lab hardware or writes control strings according to IEEE-488 conventions.

When the Chips Are Down

The 68881 option is highly recommended for using the SE as more than a simple data logger. For example, a standard Fourier Transform benchmark that requires 76 seconds without the math coprocessor takes 3.6 seconds with the 68881. The 68840 DMA controller, however, is necessary only for the highest-speed data throughput. With a directly programmed interface to appropriate instruments, the board can acquire data at 800 kilobytes per second in practice, pushing the limits of the GPIB bus standards. The DMA option can "snapshot" near-microsecond events, which makes it more useful to physicists or electrical engineers than to chemists or biotechnologists.

The IEEE-488 bus is currently the most useful laboratory data system, and

Boxes, Little Boxes

LabVIEW also implements icons for the standard GPIB bus control statements. Although *LabVIEW* itself becomes the rate-limiting factor in data transfer at very high speeds, it allows GPIB-SE interfaces to be strung together in hours instead of weeks.

National Instruments' GPIB-SE board turns the SE into a self-contained lab workstation for use with hundreds of instruments. The board can be programmed through its C interface or with the relatively expensive convenience of *LabVIEW*. The review card tested was well designed (no last-minute wiring patches), and the local distributor reported no problems in the several hundred cards it has sold for PCs and Macs.

—Charles Seiter

See *Where to Buy* for product details.

A New Image

AST TurboScan

Image-scanning hardware and software.

Pros: Gray shades with selectable halftone/line art and halftone patterns; simple setup and scanning procedures. **Cons:** Inadequate editing software. **List price:** \$1899. **Requires:** 512KE; hard disk for full-page, high-resolution scanning.

As the ability to detect and represent more shades of gray becomes commonplace in reasonably priced scanners, digitized images are beginning to be smooth and accurate enough for some serious publishing applications. A prominent member of this newer scanner crop, AST's TurboScan, is now available for the Macintosh. With the Microtek scanner engine at its heart and an innovative but unpolished Mac software package for its brain, TurboScan produces high-quality halftone images, although it makes the process somewhat more difficult than it should be.

Getting Acquainted

TurboScan is lightweight (18 pounds) and reasonably compact (15 by 17 by 4½ inches). The only control is a power switch. The back panel is also fitted with two clearly labeled serial and parallel ports. The only differences between the IBM PC and Mac versions are the interface cable and accompanying software. Cabling for both types of Macintosh serial ports (8- and 9-pin) comes with the Mac version.

FRED STIMSON

TurboScan is also easy to set up. Instead of the flatbed design used in scanners like the Hewlett-Packard ScanJet, AST chose a sheet-feeding design; a set of rubber wheels pulls your document through the device. After attaching the serial cable, all you have to do is insert a plastic paper guide into a couple of slots on top of the unit.

Planning Your Scanning

The scanning process is controlled entirely by the SuperScan software. As you'd expect, the program lets you set contrast, brightness, and resolution (from 75 to 300 dots per inch, with many intermediate settings), but it also lets you choose between line-art and halftone modes. You use the line-art mode for text, line drawings, or any image with few and/or contrasting shades; the halftone mode is for images (such as photographs) that have continuously variable shading.

TurboScan's engine is capable of detecting 16 separate shades of gray, which you can display or output in any one of 12 halftone patterns. The mouse lets you define the exact area on the page to be scanned, and you can split that area into separate portions for the line-art and halftone modes. Finding the optimum combination of all these settings can be a laborious process of trial and error, but the defaults usually produce acceptable results even while you're learning.

Feeding the Beast

TurboScan's traction feeding mechanism works smoothly, but unlike a flatbed scanner, it can't scan anything thicker than .012 inch. Nor can you feed in documents larger than 8½ by 14 inches. Using very thin paper also proved difficult; it often wrinkled in the rollers. Fortunately, it's easy to free jammed documents.

Slight but noticeable misalignment is another occasional problem that results in scanned images no longer being square on the page. Finding the correct alignment for irregularly shaped documents is purely a matter of luck.

To compensate for high-resolution scanning's voracious appetite for memory, SuperScan's virtual-memory system swaps out portions of the image to disk as needed during scanning or editing. Even with a hard drive, however, the process is exceedingly slow.

Hidden Dangers

Once an image is safely in memory, you can modify it with SuperScan's built-in graphics editor (a no-frills paint program), but not with scanning settings such as brightness or halftone patterns. Most of the standard *MacPaint* tools are provided, but some features you'd expect to find are missing, especially when it comes to selected blocks. You can't rotate an image

fragment in a block, and there's no way to resize or move the block beyond the area of the image currently visible on screen, except via the Clipboard.

SuperScan has other aggravating rough edges as well. With all but the lightest continuously shaded graphics, when you reduce the screen view of an image, it turns into an illegible sea of black that's worthless for editing. Worse yet, if there's not enough room left on your disk during virtual-memory disk swaps, the program unceremoniously crashes, as it also occasionally does for more mysterious reasons.

SuperScan's file-export facilities are adequate—in addition to its own proprietary format, you can save images in *MacPaint* and TIFF formats, and as standard or gray PostScript text files (for output on high-resolution Linotronics and similar devices).

With its gray-scale support and flexible halftone capabilities, scanned images produced with the TurboScan package are at least equal in quality to the output of any other competing scanner. Before you buy, however, be sure you can live with the limitations of the sheet-feeding mechanism and SuperScan's bugs and missing features. —Steve Cummings

See *Where to Buy* for product details.

QUED Pro Quo

QUED/M 2.04

Text Editor. **Pros:** Powerful, feature-packed text editor with macro facility. **Cons:** High learning curve for advanced features; manual complete, but dense. **List price:** \$119. **Requires:** 512K. **Copy protection:** None.

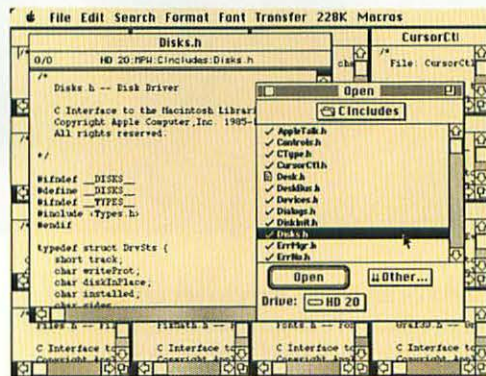

While the Macintosh allows tremendous flexibility in how printed words appear, developers haven't had the same sort of flexibility in manipulating those words before they are printed. Paragon Concepts' first version of *QUED* (*Quality Editor for Developers*) made it easier for developers to create and edit their source code. Now, two years later, that program has evolved into *QUED/M* 2.04 (*Quality Editor with Macros*), a powerful tool that should find even wider acceptance.

Mucho Memory

QUED/M is a memory-based editor, which means that it keeps the entire document it's working on in memory all the time. It's capable of working on as many documents at one time as will fit in memory.

The drawback of a memory-based text editor is that document size is limited by available RAM. On a Macintosh Plus with 1 megabyte of memory, though, this means a document size limit of about 300K—not a

QUED/M's Window Tiling

QUED/M allows you to work easily with many documents simultaneously.

bad trade-off when you consider the outstanding speed of this memory-based editor. Also, RAM prices are coming down rapidly; soon 2.5MB and 4MB Macs will be commonplace. By automatically taking advantage of available RAM *QUED/M* will handle documents larger than you'll probably ever need, even if you have a 4MB Mac Plus or even an 8MB Mac II.

Custom Editing

QUED/M allows you to select and open multiple documents simultaneously through its custom standard-file dialog box. It permits easier document management, too, by letting you either stack or tile the windows on screen (see "*QUED/M's Window Tiling*"). You can view documents in your choice of font and size, and optionally display line numbers, ASCII codes, and character/word-count information. It also lets you place invisible markers within your text, making it simple to jump instantly to a designated place in your document.

With *QUED/M's* Find and Change commands you can search your document

for text strings and change them. In addition, the program supports regular expressions, so you can search not only for literal text strings but also text patterns with one command. Text searches can take place within a current document, across all open documents, or across selected unopened documents on a disk.

Features Galore

For programmers, *QUED/M* keeps track of matching parentheses throughout a document. It can search through a document and alert you to any unbalanced parentheses, or optionally alert you to unbalanced parentheses as you type. *QUED/M* also lets you define your own "parentheses," allowing it to keep track of matching marks including " ", ' ', [], and { }, as well as notations specific to programming languages, like begin/end pairs in Pascal and /* */ comment delimiters in C.

Another unique feature of *QUED/M* is its ability to "fold" text, much like an outline processor does. By simply selecting a range of text and the command Hide Text, you can represent that range of text by its bulleted first line only. As with an outline processor, clicking on the bullet enables you to expand and collapse the text. This feature is useful for compressing longer documents or for showing only headings or function names in source code.

QUED/M has many more features, including synchronized scrolling and the ability to compare two documents. But its macro facility is what truly sets it apart from other commercial text editors. Nearly every command within *QUED/M* is also available as a macro command. When you take into account this editor's regular-expression support, the amount of flexibility you can have in writing macros is truly remarkable. As part of the package, Paragon Concepts includes over 50 sample macros that demonstrate the program's capabilities.

QUED/M's abundance of features lengthens the learning curve for users. Fortunately, the number of features does not get in the way of taking advantage of the program's power. There are a few diversions from the standard Mac user interface (like the custom standard-file dialog box), but many of these contribute to the program's extended functionality. *QUED/M's* manual is quite complete, but the descriptions of features are packed into it almost as tightly as the features are packed into

the program. A longer tutorial section would be helpful.

To say that this program has a lot of features is an understatement. *QUED/M* is among the most powerful Macintosh text editors available, including those bundled or integrated into some development systems.—*Jim Takatsuka*

See *Where to Buy* for product details.

Fry the Unfriendly Skies

Tactical Jet Fighter 1.0

Flight simulation game. **Pros:** Very simple to begin playing; provides no-frills combat action. **Cons:** Eliminates critical real-life aviation and combat hazards; does not provide complete takeoff-to-landing simulation. **List price:** \$44.95. **Requires:** 128K. **Copy protection:** Key disk.

Tactical Jet Fighter is an air-to-air/air-to-ground combat game with simplified flight simulation features. This stripped down, straightforward shoot-'em-up assumes that you're not interested in learning all the details of flying an airplane before nose-diving into action. Although some skill-building time is required, particularly for players with no previous flight simulation experience, learning is relatively quick; many complicated actualities have been left out, so you can begin play almost immediately. There is no scoring system, but the game's 16 missions maintain a fast enough pace to hold the action-crazed attention of many Top Guns, if not of the more demanding connoisseurs of flight simulation.

Simplicity over Sophistication

You don't have to worry about takeoffs or landings—*Tactical Jet Fighter* is combat action without the down time. Each of the game's attack missions begins in the air, in a world approximately 100 miles square where there are stationary targets on land, sometimes protected by enemy jets, as well as other sketchy little shapes representing enemy tanks, railroad cars, and PT boats. Destroying all ground targets is the objective of each mission.

This game's Mach 1.5 jet will do wonders for your military budget—it comes with unlimited fuel. And like Rambo, *Tacti-*

cal Jet Fighter pilots never run out of cannon ammo, rockets, bombs, and guided missiles, though there are limits to how many weapons you may fire at once. As a further incentive to uninterrupted play (eliminating irritating restarts), you can fly smack into the ground and then take off again without being killed. Designed to keep the war machine going and the fun simple and nonstop, these features unfortunately also tame the contest considerably.

Limits and Flaws

Tactical Jet Fighter runs at good speed on the Mac 128K and 512K. But the programming priority of a quick frame rate also prohibits sound and reduces graphic detail. *Tactical Jet Fighter's* on-screen aircraft control panel is a recognizable version of the real thing; the mouse functions as the pilot's joystick, and keys on the keyboard serve as controls. Four weapons systems are arrayed, as well as short- or long-range radar, pilot's viewpoints, throttle, brake, and landing gear (which is used for braking but not for landing). There is no keyboard option for stick control and no means to adjust the amount of tension or

play in the stick, nor are there menus for customizing anything else. Simplicity cuts both ways.

Although *Tactical Jet Fighter's* instruction manual admits it is different from "high-fidelity flight simulation," it remains true that a lot more of everything is packed into the best-selling *Microsoft Flight Simulator*, including a realistic World War I dogfight. *Flight Simulator* can provide real pilot training, too, but it is not simple. If you burned out on Silicon Beach's *Airborne* but still need a fix of fast-firing action, you may enjoy the *Tactical Jet Fighter* workout, especially if it turns up at a discount price. Those who want more substantial graphics and sophisticated flight simulation should look elsewhere.

The fatal flaw (or nonfatal flaw) of *Tactical Jet Fighter* is that its pilots don't risk being shot down. You cannot be destroyed in a crash, stall during takeoff, or go into a spin after being hit. *Tactical Jet Fighter* is a thinly drawn game of target tag in which the player is "it," the target is usually stationary, and the enemy never shoots back. Rambo wouldn't even grease up for this one.—*Keith McCandless*

See *Where to Buy* for product details.

It's the highest achievement to be both beautiful and

In the field of nature, the design skills of the hen and the spider have rightfully earned universal acclaim.

In the field of desktop publishing software, the same credentials apply to Letraset, leaders in graphic design for nearly 30 years.

And now Letraset proudly introduces its most recent achievement: Ready Set Go! 4.0™ page layout software for the Macintosh™ embodying

the perfect balance of desktop publishing beauty and productivity.

For the artist in you, RSG! 4.0 offers innovative design features that allow you to produce pages that are excitingly creative.

Including automatic run-arounds that make it easy to create extraordinary visual effects. An elegant new tool bar that keeps your tool boxes accessible to each docu-

ment you're creating. Powerful snap-to design grids that help you interactively place text and graphics and visualize designs as you go. Facing pages that allow you to view, edit and lay out a two-page spread. "Lock-and-Don't-Print" features that let you produce multiple pages for color overlays. And over 50 fill-and-pen patterns, based on Letraset's popular collection of rules and borders,

evement of great design d functional.

to create a variety of special graphics.

The practical side of you will be pleased to learn that RSG! 4.0 is also packed with a wide array of powerful time and effort saving production features.

For example, RSG! 4.0 comes equipped with full-function word processing and a built-in 100,000-word spell checker that can suggest correct spelling alternatives. Style

throughout a one-page layout or an extensive multi-page document with a single keystroke. A linker tool that allows text to flow automatically as new text or graphics are needed. And RSG! 4.0 even boasts tabloid-size page formats up to a generous 99×99 inches.

In other words, RSG! 4.0 is the first page layout software of its kind. A tool for those who recognize that

sheets that let you make formatted changes

great design is the product not only of powerful creative resources, but of a genius for efficient production.

Any authorized Letraset graphic design software dealer will be glad to illustrate the above with a Ready Set Go! 4.0 demonstration. For the name of the dealer nearest you, just call (800) 722-0377.

Great designers have never accepted the limitations of reality. Neither should you.

Reality.

Reality Improved by ImageStudio.

INTRODUCING IMAGESTUDIO: RETOUCHING SOFTWARE FOR THE MACINTOSH.

Reality is notoriously uncooperative. Which is why designers have always taken liberties with it. And now, thanks to ImageStudio™, you can do the same.

ImageStudio is the image processing software that transforms your Macintosh™ into one of the world's most versatile retouching studios.*

Electronic artist's tools let you handle everything from repair work on the Colosseum to airbrushed embellishments on your favorite illustration. Including softening or sharpening edges, changing brightness or contrast, scaling, cropping or rotating images, and more. Plus 64 shades of gray to work with.

ImageStudio not only accepts images from most scanners, it lets you use them in most page design software applications, including our own Ready Set Go! 4.0™. And you can print them out on any PostScript®-compatible printer.

The result is printed materials designed to truly professional standards. Made possible by Letraset, the world's leading supplier of tools for those who put words and images on paper.

Visit an authorized Letraset graphic design software dealer for a demonstration. For the dealer nearest you, just call (800) 722-0377.

hardware, and accessories*

Edited by Eileen Drapiza

This section covers Macintosh products formally announced but not yet evaluated by *Macworld*. All prices are suggested retail. Please call vendors for information on availability.

SOFTWARE

Apache Strike and Beyond Dark Castle *Strike* allows the player to fly a McDonnell Douglas AH-64 Apache attack helicopter in between skyscrapers, fighting enemy helicopters, jets, and tanks while seeking out the enemy's strategic-defense computer. 3-D animation. In *Beyond Dark Castle* the hero battles through chambers filled with obstacles and bad guys. 512KE min. memory. \$49.95 each. Silicon Beach Software, 619/695-6956.

Arrow Dynamic and Caspian PostScript Font Families The Arrow Dynamic family includes regular, bold, and heavyweight arrow sets featuring various background styles; accounts for all eight major compass points. Caspian is a calligraphic serif face. \$43 per disk. EmDash, 312/441-6699.

Carousel Color Slide Software Design 35mm color slides from *MacDraw* and compatible object-oriented applications. Select from 256 colors per palette. Optional processing service provides 48-hour delivery. 512K min. memory; requires 1200-baud modem. \$249. 20/20 Data Systems, 512/454-2508.

ColorLab Presentation program displays up to 256 colors on the Mac II, or transfers to 35mm color slides with a film recorder. Features include sorting, full centering, a transparent show-through option, and text

coloring. Controlled or continuous operation. 1MB min. memory. \$495. Language Systems Corp., 703/478-0181.

Comic People Clip art for use with *The Comic Strip Factory* or other *MacPaint*-compatible graphics programs. Contains seven new characters and an office background. \$39.95. Foundation Publishing, 612/935-4230.

Complementary Type PostScript fonts for display, body copy, and borders: Highland Gothic, Highland Gothic Light, Fatti Patti, Vertigo, Cut Outs, Nouveau, Kasse, Hobnob, Fletcher Gothic, Peruta Medium and Light, Calculus, Michelle, Bodette Borders. Each disk contains at least two faces. \$69 per disk. Software Complement, 717/491-2492.

Cricket Presents... Color presentation program. Integrates text handling and drawing tools; imports PICT files. 512KE min. memory. \$495. Cricket Software, 215/251-9890.

Cyclesoft Training log for bicyclists. Includes calendar for setting goals; generates progress reports and charts. 512K min. memory. \$49.95. Game Plan, 714/949-9599.

Desktop Publishing Type & Graphics *HyperCard* stackware version of the reference book. 1MB min. memory; requires *HyperCard*. \$15. Publishing Resources, Inc., 303/442-1100.

Dessert Sampler Collection of 200 Mac graphics on disk. Available in a variety of formats. One-year subscription \$249.50; includes catalog and disk. Moby Disk, Inc., 303/948-2678.

Different Drummer Lets your Mac become a drum machine, complete with snare and kick drum; ride and splash cymbals; high hat closed and open; tom lo, med, and hi; bell; hand clap; shaker; cowbell; and wood block. Records drumbeat patterns. 512K min. memory. \$99.95. Primera Software, 415/525-3000.

FB Pro and TX81Z Pro Editor/librarian package for Yamaha's FB-01 and TX81Z synthesizers. FB Pro \$129, TX81Z Pro \$139. Digital Music Services, 714/951-1159.

ForeRunner Scripting utility for creating batch files. Bundled with Lock Out and Fast Formatter. 512K min. memory. \$49.95. Beyond, 602/888-8667.

GraphPainter Presentation graphics program with curve fitting. 1MB min. memory. \$50. Greg Brasel, 314/256-3317.

GYST Client-management database. Preset screens and data-entry fields may be customized. Includes an integrated appointment calendar/clock. 512K min. memory. \$199. Contact Systems, Inc., 404/953-8242.

Handwriting Analyst Questions user about handwriting-sample shapes and formations, then analyzes and reports on writer's emotional characteristics, intellectual style, personality traits, social behavior, and vocational implications. 512K min. memory. \$49.95 plus \$3 shipping and handling. Ciasa, 415/644-2771.

HeadStart Customizable business database template for *dBase Mac*. Structured for personnel management, sales, marketing, accounts receivable/payable, and inventory. 1MB min. memory; requires *dBase Mac*. \$169. DigiCorp, 801/562-2227.

New Products

Inside Out Database toolbox for programmers. Supplied in linkable object code; includes a set-up program for defining database schema. 1MB min. memory. Single-user program tools \$395, multiuser program tools \$595. Shana Enterprises, 403/438-6548.

Insight Inventory Control, Multi-User Modules, and OneWrite *Inventory Control* monitors stock levels and maintains inventory valuation. *Multi-User Modules* allows several users to work on records simultaneously. *OneWrite*, modeled after the balance-forward accounting method, is intended for small service companies. 512KE min. memory. *Insight Inventory Control* \$595, *Insight Multi-User Module* \$895, *Insight OneWrite* \$299. Layered Inc., 617/242-7700.

Jam Session Lets inexperienced players create and record professional-sounding music on the Mac. 512K min. memory. \$49.95. Brøderbund Software, 415/492-3200.

LearnMore Three self-paced *More* tutorials. Covers fundamentals, tree and bullet charts, and tips and templates. \$49.95 each, plus \$5.95 shipping and handling. Personal Training Systems, 408/559-8635.

Loan Qualifier Templates for *Jazz*, *Crunch*, *Microsoft Excel*, and *Works*. Qualifies clients and calculates loan costs. Designed for mortgage brokers, loan officers, and real estate agents. \$99. Financial Microware, 408/733-6705.

MacLinkPlus/Wang VS Provides complete access to the Wang VS system. Includes Wang VS workstation emulation, and file-transfer and document-conversion capabilities. 1MB min. memory. \$395. DataViz, 203/866-4944.

McMax dBase-compatible database-management system. Supports Microsoft formats. 512KE min. memory. \$295. Nantucket Corp., 213/390-7923.

On Call Interactive medical adventure game with text, sound, and animation. 512K min. memory. \$15. Goose Creek Software, 803/553-1805.

PageMaker Portfolio: Designs for Business Communications Package of 18 templates for proposals, memos, overhead transpar-

encies, reports, handbooks, and business plans. 512K min. memory; requires *PageMaker*. \$99. Aldus Corp., 206/628-2375.

PIXymbolsKeys and PIXymbolsTwo *PIXymbolsKeys* consists of downloadable PostScript pictorial fonts as well as screen fonts of all Mac-keyboard keys. *PIXymbolsTwo* includes more than one hundred additional characters. 512KE min. memory. \$50 each. Page Studio Graphics, 602/839-2763.

Plundered Hearts Interactive romance fiction set in the seventeenth century. You are a young woman voyaging on a schooner bound for the West Indies. \$39.95. 512K min. memory. Infocom, 617/492-6000.

PsychroMouse Engineering software that calculates psychrometric properties for cooling loads. 512K min. memory. \$79.95. TechWare, Inc., 816/782-1249.

Rendezvous Electronic calendars in 12-month-perpetual, weekly, and 24-hour-day formats. Records notes in a centralized database; has search capability. Includes an automatic appointment reminder and a mini word processor. 128K min. memory. \$200. PMC Telesystems, 604/255-9949.

StatView II Statistical data analysis and color graphics package for the Mac II. Analyzes a full range of statistics at mainframe speed; lets you customize graphs. Requires Mac II or SE/Plus with 68881 coprocessor. \$495, demo disk \$15. Abacus Concepts, 415/540-1949.

Super 3D 3-D color graphics modeling and animation for professional engineering and graphic arts applications. Rendering tools include perspective, hidden-surface removal, shading, color, and sophisticated shapes. Enhanced version takes advantage of Mac II color capabilities and the 68881 math coprocessor chip. 512KE min. memory. *Super 3D* \$295, *Super 3D Enhanced* \$495. Silicon Beach Software, 619/695-6956.

Trust & Betrayal: The Legacy of Siboot Interactive science fiction in which players strive to acquire power. 512K min. memory. \$49.95. Mindscape Inc., 312/480-7667.

HARDWARE

The Big Picture for the Mac II 32-bit video controller and an ECL video signal. 17-inch monitor with 1024- by 808-pixel resolution; paper-white phosphor. Video card and monitor \$1995, video card \$795. E-Machines, 503/692-6656.

JDL-850 GL+ Plotter for 2-D/3-D drafting applications. Produces color plots on media up to 18 by 24 inches; handles shading, dithering, and polygon-fill tasks required in 3-D modeling. \$3845. JDL Inc., 805/495-3451.

LaserView for Mac II Displays four shades of gray and two resolution modes: 1664 by 1200 pixels, or 832 by 600 pixels. Landscape mounted; paper-white phosphor; 75-KHz scan frequency. Refreshes at 60 Hz, noninterlaced; 160-MHz bandwidth. 15-inch screen \$1595, 19-inch screen \$2395. Sigma Designs, 415/770-0100.

MacADIOS II Ten boards for scientific and engineering applications, such as laboratory data acquisition, speech analysis, signal generation and analysis, and external process control and monitoring. \$1500 to \$10,000. GW Instruments, 617/625-4096.

Mac&Touch Glass touch screen with mouse-compatible software driver. \$995. MicroTouch, 617/935-0080.

MacPBX Integrates a Mac with any PBX system. Controls phone lines from Apple menu. Includes telephone-line interface. \$249. Computer Phone Solutions, 305/653-4500.

Moniterm Viking 1 19-inch monochrome monitor for Mac SE. 1280- by 960-pixel resolution. 66-Hz refresh rate, noninterlaced; features extend, magnify, and WYSIWYG display modes; hardware screen saver. \$1995. Moniterm Corp., 612/935-4151.

MSC Color Display Card 1280 by 1024 pixels, 32 bits per pixel. One, two, three, or four color planes of 8 bits each, RGB, and YMCK color processing; vertical refresh from 40 to 70 Hz, software-selectable; RGB Sync standard output (fourth channel optional); genlock and three or four inputs for frame-grabbing. External add-on hardware fully supported. Approximately \$2500. Micro Systems Consultants, 818/997-0408.

Announcing the publications you really

We've just rendered your current Macintosh media schedule obsolete. Because now, we publish the *only* two magazines you really need to reach — and own — the entire Macintosh market.

Macworld, of course, leads the way and is the #1 monthly Macintosh periodical with a circulation reaching 200,000 in January. It's aimed at all educated business market users: From government to universities, from science to home to businesses of any size. It's instructional, with an average of 20 in-depth product reviews per month. It's comprehensive, with departments including Macworld News, Verbatim, New Products, a variety of "how to" articles, Macintosh Best Sellers, even Where to Buy information. Because of all this, it's become a "must" media buy in reaching the wide Macintosh audience.

And now, there's *Macintosh Today*. It's the premier newspaper for news and information for the Macintosh market. Reaching users in large and medium size companies.

It delivers late-breaking news and product announcements, along with the hottest information to keep its readers on top. It provides solutions to personal computing problems, commentary on emerging industry trends, as well as updates on desktop publishing, office automation and desktop communications.

The 1-2 media punch of these synergistic PCW publications will give you unparalleled Macintosh market clout. So buy them together now, and we'll even give you a joint media discount. And you'll own the entire Macintosh market, for less.

Call us today at (415) 546-7722. Ask for Jim Martin, V.P. and Group Publisher. We'll make your job easier while your Macintosh media dollars work a lot harder.

Re-ink Your Printer Ribbon for Less than 5 cents

\$42.00

Mac Inker™ Imagewriter I & II
complete with
free bottle of ink

MAC INKER™, the automatic ribbon re-inker. Over 100,000 sold - over 11000 printer cartridges and spools supported - with the Universal unit. Our dark dot matrix ink, lubricated and solid-free, yields a truly better than new print quality and helps extend print head life. We have a full range of optional accessories, special inks and cartridges: UV resistant, indelible, OCR, heat transfer. Color: red, green, blue, yellow, purple, brown, orange, silver, gold. In 1982, we pioneered ink and re-inking technology and are committed to its advancement.

Universal Mac Inker **68.50**
Multicolor Adaptor* for 4 color band Imagewriter cartridges **40.00**
Shipping **3.00**
*fits both the Imagewriter Mac Inker or the Universal Mac Inker

Mercury and Capricorn Modems

All our modems are 100% (guaranteed) Hayes compatible and have a 2 years warranty. Full, front panel control lights, auto answer, auto dial, auto repeat, call progress monitoring and speaker control.

Mercury 1200 AT 300/1200 baud **149.00**
Mercury 2400 baud **249.00**
Capricorn World Minimodem. 300/1200 baud,
pocket size with Bell 103/212A
& European CCIT V.21, V.22 standards **169.00**
Quick Link Communications Software (if purchased with Modem) **15.00**
Cable to Modem (specify Macintosh type) **15.00**

Data Switches for the Macintosh

MS4-MAC, 4 port, 9 pin female
connectors mounted **50.00**
MS4-MAC8, 4 port, 8 pin,
DIN-8 connectors (for the
Plus, SE and MAC II) **50.00**
SCSI Switch - 2 port **46.00**
SCSI Switch - 4 port **59.00**
Cables **15.00**

New Products

The Macintosh Valet A flexible, rotating arm that holds the Mac's mouse, disk drive, and keyboard 6 to 8 in. above desk surface. Platform rotates 90 degrees to left and right; arm extends to a 36-inch radius. Steel construction. \$139.95. MicroComputer Accessories, 213/301-9400.

Mandale Power Shield Lightning and surge protector for complete electrical and electronic systems. \$199.95. Mandale Corp., 919/376-9570.

ProTech Laser Ultra and Envelopes White glare- and curl-free paper for laser imaging. Coated for wax pasteup. Slightly oversized #10 envelopes in bright white let you print graphics and text in one pass on front and flap. Adhesives are heat resistant. 250 sheets of Laser Ultra \$20.95, 100 envelopes \$15.75. James River Corp., 800/521-5035.

Quickcolor Formats Partially preprinted paper for overprinting. Accommodates a #10 trifold brochure, pamphlet, or self-mailer, with solid wraparound background color on the front and back panel. Colors include: Newport Blue, Kentucky Green, Georgetown Gray, and Cambridge Red. 100 sheets \$9.95, 400-sheet rainbow pack \$29.95. Intergraphix Corp., 617/331-8088.

TLP-2 Telephone-line/modem voltage surge protector. Plugs into standard three-prong AC wall outlets. Dissipates up to 6000 volts, 14,000 amps, 142 joules of surge energy. \$39.95. Kalglo Electronics Co., 215/837-0700.

Wing Color Pack Adds colors to laser-printed documents. Includes materials for treating up to 50 pages. No additional hardware or software required. Starter pack \$39.95. Wing Color, 800/541-0900. □

To have your product considered for inclusion in New Products, send an announcement with product name, description, minimum memory, peripherals required, pricing, company name, and phone number to New Products Editor, Macworld, 501 Second St., San Francisco, CA 94107. We reserve the right to edit press releases.

DOES WILLIAM F. BUCKLEY, JR. REALLY NEED A THESAURUS?

If you've ever watched his show *Firing Line*, you know Bill Buckley to be one of the most articulate, erudite people who ever spoke the King's English. His superior vocabulary makes you lean forward in your chair to keep up with him. If anyone could get by without a thesaurus, he could. But we have his letter praising our comprehensive, contemporary Word Finder. No big words, just a nice letter saying how much he liked it and uses it. Didn't mention the 220,000 synonyms for 15,000 words. Didn't say anything about how in just seconds Word Finder performs the whole cycle of look-up and replacement, so you continue writing

without taking your eyes off the screen or your fingers off the keyboard. Nothing about how simple it is—just select the word you want an alternate for, and up pops a window of synonyms. Pick a new word and the window disappears, and your new word takes the place of the old word. But he did say: "It's a bloody miracle. Word Finder has changed my life. I never used to use a thesaurus."* To order call 800-828-6293 (in New York State call 716-377-0130).

Word Finder installs as a desk accessory. It is not copy protected.

Retail \$59.95

*Mr. Buckley volunteered this statement about Word Finder, and is not being compensated for his endorsement.

Every place you look you'll see rave reviews. Why? Because Cricket Draw has created a new state-of-the-art in Macintosh drawing technology.

Spectacular Special Effects

Cricket Draw's most universally acclaimed capability is its special effects generation. A quick glance at the example at left will give you a feeling for what can be accomplished with a little imagination and Cricket Draw. Graded Tones (fountains), Shading, Text on any path — all these effects and more are simple with Cricket Draw.

For Creators . . .

If you use your Macintosh to create graphics, then you certainly want the industry's most comprehensive set of drawing tools. You want the industry's most advanced text manipulation tools. And you want the ability to take full advantage of PostScript equipped devices. With the Power of Cricket Draw, you can finally unleash your true creative potential.

For Professionals . . .

Graphic Arts? Desktop Publishing? Cricket Draw allows you to create prescreened, camera-ready art, complete with typeset copy.

THE FIRST FAMILY OF GRAPHICS

When it comes to Macintosh graphics software, there's just one name to remember — Cricket Software. Your local dealer will be happy to introduce you to the entire family: Cricket Graph, Cricket Draw, Cricket Presents . . . , and Cricket Device Drivers.

Quick Tips

Answers to your questions

by Lon Poole

The August *Quick Tips* included a tip about reducing the font size of a blank space to bring adjoining words closer together. Audrey Ramm of New York City suggests changing the font itself to make the blank space smaller. For example, if you use Geneva 12 and New York 10, changing spaces to Geneva 9 and New York 9 makes them smaller. Substituting Helvetica 9 and Times 9 makes the spaces smaller still. Conversely, using a font that takes up more room, such as Athens or London, will expand word spacing.

Q Switching Start-up Disks

When I eject a start-up disk, insert another start-up disk, and try to open an application on the second disk, the Mac asks me to swap disks. Why? Shouldn't it switch to any disk that contains the Finder?

*Todd Andros
Coral Gables, Florida*

A The Mac does switch start-up disks under the circumstances you describe. But it may ask you to insert the old start-up disk so that it can update that disk's invisible desktop file. (The desktop file keeps track of Get Info comments and icon and window arrangement.)

The Mac does not automatically switch start-up disks if the current start-up disk is a hard disk. However, you can force it to switch by pressing the Option key while you open an application on another start-up disk. You can also force a switch to another start-up disk by pressing the Option and \mathbb{H} keys while opening the Finder icon. The Mac won't switch start-up disks at all if you're using MultiFinder.

Remember that a start-up disk must contain both the Finder and System files. On an 800K disk or any other disk that uses

the Hierarchical File System (HFS), they must be in the same folder—usually the System Folder.

Q Em Dash

I need to use a long dash in my writing—as in setting off this phrase—but I don't want to use two hyphens as I normally do.

*Paul Stobnicke
Syracuse, New York*

A An em dash (—) is the usual replacement for double hyphens. You type it by pressing Shift-Option-hyphen. An en dash (–) is shorter than an em dash but longer than a hyphen. Type an en dash by pressing Option-hyphen.

You may also wish to use opening and closing quotation marks (for example, Hoagy Carmichael's "Stardust") instead of the usual simple tick marks (Four Tops' "Bernadette"). Type Option-[for ', Shift-Option-[for ", and Shift-Option-] for ". Use the Key Caps desk accessory to investigate other punctuation and characters you can use to bring your documents closer to typeset quality.

Q Temporarily Enlarged Text

A friend of mine has very poor eyesight and wishes to write and edit his 500-page book using an 18-point font. But he wants to reduce the entire document to 12-point size for printing. How is this possible without having to slowly highlight all that text?

*Jeremy M. Brown
Brampton, Ontario, Canada*

A There's a quick and easy method for selecting an entire document that works with almost every Macintosh

word processor. First, click at the beginning of the document. Then scroll to the end of the document (by dragging the white box to the bottom of the vertical scroll bar). Finally, press Shift while you click at the end of the document. Some word processors have even simpler methods. In *Word*, for example, you move the pointer to the left edge of the document window (where it changes to point right instead of left), press \mathbb{H} and click.

However, you may not always want to change an entire document to one font size. Headings may be larger than body text, for example. If your word processor has style sheets, you can use them to control the font sizes of different types of paragraphs independently. *Word* 3.0's Define Styles command gives you this ability.

A completely different approach is to use the application *InLarge* (\$95 from Berkeley System Design, 1708 Shattuck Ave., Berkeley, CA 94709, 415/540-5536). It provides you with a "magnifying glass" whose size and strength you specify. The "glass" can magnify from 2 to 16 times and can be as small as 64 by 64 pixels (about 7/8-inch square) or as large as a whole screen. *InLarge* is specifically designed to assist visually impaired Macintosh users.

InLarge can also invert the display so that it's predominantly white on black.

Q MacDraw Out of Order

MacDraw works just fine on the Macintosh SE at my office but refuses to open a new document properly on my SE at home. I can open and edit an existing document, but a new "Untitled" drawing window shows up tinted gray, and none of the drawing tools work. I discovered that the program works fine if I start up with either the *MacDraw* disk or the System Tools disk, so I assume there must be something

Circle 670 on reader service card

How To/Quick Tips

wrong with the System file on my hard disk at home. I tried copying the System file from the System Tools disk to my hard disk, but I still have the same problem with *MacDraw*. What's wrong with my hard disk?

*Charles T. Bobanan
Decatur, Georgia*

A The System Folder on the start-up disk must contain a printer resource, or *MacDraw* (versions 1.7 and 1.9) will exhibit the symptoms you describe. Drag the ImageWriter or LaserWriter icon from the System Folder on the System Tools disk to the System Folder on your hard disk.

Q Hard Disk Partitions

Is there a utility available that allows SCSI hard disks to be partitioned into two or more parts so that they may be used as separate drives? I have a Mac SE with internal and external hard disks.

*Jack Zbe
Freeville, New York*

A I've used *Hard Disk Partition* version 1.05 with good results (\$54.95 from FWB Software, 2040 Polk St. #215, San Francisco, CA 94109, 415/474-8055). It's a desk accessory you use to create partitions and to manually mount and unmount them. (Mounting a partition is analogous to inserting a disk; unmounting is analogous to ejecting a disk and dragging its icon to the trash.) Partitions can also be mounted automatically during start-up. Once mounted, a partition behaves like a regular disk.

However, *Hard Disk Partition* can only be used with the start-up disk (probably your internal hard disk). FWB Software is working on a new version that will work with more than one drive; FWB hopes to have it available early in 1988.

Two Word Word Counts

Tip: I used the tip in the September 1987 *Macworld* ("Insights on Microsoft Word 3.0") for counting words in a *Word* 3.0 document and discovered a quicker and simpler variation. With the flashing insertion point at the beginning of the document, choose Change from the Search menu. In the Change dialog, enter ^w in the Find What box, enter ^n in the Change To box, and click Change All. At the end of the operation, look at the lower-left corner of the document window to find the num-

Why you should buy a mouse with no moving parts.

One simple reason. No moving parts. And that means no problems.

Introducing the A+ Mouse from Mouse Systems. The A+ Mouse is an all optical mouse with no moving parts. It doesn't depend on friction, so there aren't any parts that can slip, get dirty or wear out. It doesn't have a rolling ball, a commutator, little teeny bearings and shafts, or plastic housings housing who-knows-what.

Instead, our mouse uses a mirror-like pad that reflects a tiny beam of light to track your slightest hand movement. No other mouse moves as fast or is as reliable.

Especially when you're moving around in spreadsheets and graphics software or editing text and manipulating data. That's because our mouse gives you up to 200 counts per inch and digital accuracy for exceptional cursor control.

Plus solid state electronics to ensure precision. No matter what Apple system you have, we have an

A+ Mouse that's right for you.

The A+ Mouse is compatible with the Macintosh 512K, Macintosh Plus, Apple IIc and Apple IIe (which requires the Apple mouse card).

The A+ Mouse ADB is ideal for the Macintosh SE, Macintosh II, and Apple IIGS.

The A+ Mouse. The mouse you'll never have to clean, repair or replace. It's so reliable, it's the only mouse which comes with a Lifetime Warranty.*

See your local dealer for a demonstration. Today.

A+ MOUSE
MOUSE SYSTEMS

Desktop *Express*TM

because great minds seldom think alike.

The Meeting of the Minds With Desktop *Express*TM software, the great mind in New York can see what the great mind in L.A. has been trying to say.

Send text *and graphics*, using a MacintoshTM, a modem and MCI Mail[®], to your associates in the next office, or in the next state. With this new electronic mail and document delivery service, they'll get the picture clearly anytime – day or night – via MCI Mail.

Desktop *Express* extends the 5 o'clock "express" deadline, so working across time zones can be as efficient as working across the hall. And, it replaces those fuzzy facsimile figures and forecasts with high resolution graphic presentations. Send ideas back and forth in a matter of minutes and accomplish in an afternoon what would normally take several days of overnight courier exchange.

Created by Dow Jones, Apple, and MCI, Desktop *Express* works with the Macintosh software programs you've come to rely on. Create a business plan complete with charts, graphs and spreadsheets. Send it to any of your associates who have Desktop *Express*. They can review the plan and even print it – all *without* the software program you used to create it. But if they do have the program, and Desktop *Express*, they can revise your document on the spot and return it to you.

For your associates who don't own a Macintosh, Desktop *Express* still delivers. Direct your documents electronically to an MCI Mail Print Center. There they will be printed on a laser printer and delivered via postal or overnight delivery.

With Desktop *Express*, your big ideas will get looked over, not overlooked. So, for the Apple Dealer in your area call 1-800-538-9696 Ext. 350.

Desktop *Express*. Now, great minds don't have to think alike to get the picture.

DowJones[®]

P.O. Box 300, Princeton, NJ 08543-0300. Desktop *Express* is a trademark of Dow Jones & Company, Inc. © 1987 Dow Jones & Company, Inc., All Rights Reserved.

Circle 355 on reader service card

Symbol	Formula	Characters Combined
\bar{X}	$\backslash o(X, \backslash s.\backslash up11(_))$	"X" and superscripted "_"
P_t	$\backslash o(P, \backslash s.\backslash up12(.)), \backslash s.\backslash do5(t)$	"P", superscripted ".", and subscripted "t"
$\sim Y$	$\backslash o(Y, \backslash s.\backslash do11(\sim))$	"Y" and subscripted "~"

Combining Characters

Transform standard characters into special characters using Word 3.01's math-formula commands to combine the Overstrike and Superscript/Subscript commands.

characters using Word 3.01's commands for typesetting math formulas. This avoids the hassle of creating special fonts or having to use MacDraw or MacPaint to draw special characters and then paste them into the Word document. To create special characters, combine the Overstrike command and the Superscript/Subscript command. For some examples of symbols often used in statistics and economics, see "Combining Characters."

Stuart M. Glosser
Whitewater, Wisconsin

While typing formulas, be sure the Show ¶ option is active (choose Show ¶ from the

Edit menu). When you finish typing the formula, choose Hide ¶ from the Edit menu to see the results.

Be sure to prefix every formula command and ¶ option with the formula character, which you type by pressing Option-¶-backslash. Word displays this character as a backslash preceded by a dot (.).

The Overstrike command superimposes two or more characters. Options let you align the superimposed characters at their centers, left edges, or right edges. The Displace command is similar to the Overstrike command. Displace lets you space forward or backward any number of points between two characters to make them overlap.

The Superscript/Subscript command

moves a character up or down the number of points you specify. Keep in mind that if you change fonts, styles, or font sizes, you may have to adjust the number of superscript or subscript points.

The Word manual and online help have more information on formula commands. Look under "Formulas."

E-Z Row, Column Insertion

Tip: I found this shortcut the other day in Excel 1.04. When working on a worksheet or macro, press the Option key and click or drag a row, column label, or cell to quickly insert single or multiple rows, columns, or cells.

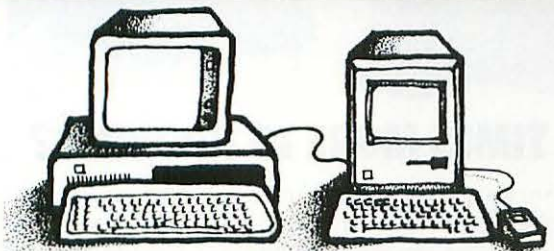

Barry J. Lutz
Chicago, Illinois

Quick Eject in Font/DA Mover

Tip: To eject a disk while using Font/DA Mover, hold down the Option key and click the Close button. This saves the time and trouble of clicking Close, then Open, and finally Eject.

James Staudte
Burke, Virginia

THE THUNDERSCAN FACE-OFF.

WHICH SCANNED IMAGE COST NEARLY TEN TIMES MORE TO PRODUCE?

It's tough, isn't it. They both look great. But the image on the left was digitized by a scanner that costs over \$2,000. The image on the right by ThunderScan®. The scanner that replaces ImageWriter's* ribbon cartridge. Just \$249 complete.

Now, we'll admit, the more expensive scanners are faster than ThunderScan. But what we lack in speed, we make up for in software power. And that can actually save you time in the long run. Because with ThunderScan there's no rescanning an image to get it right.

ThunderScan saves true gray shades. So once an image is scanned, you can change it any way you want. As many times as you want. Control contrast and brightness. Create special effects. Take your image at face value or enhance it to your art's desire.

ThunderScan also gives you true halftones. So you can tap the full resolution of your printer. (We tapped the Linotronic® 300 for the above images, but you can use your ImageWriter™ or LaserWriter™).

Use LaserWriter to create line screens and frames.

Now you can plug high-resolution halftones into your PageMaker®, Quark XPress™ or ReadySetGo!™ documents. Or use your scanned images with painting and drawing software like Illustrator™ and LaserPaint™.

ThunderScan's special effects include straight line screens, rotations and frames. Plus, you get a lasso for working with irregular shaped areas. And with our new Power Port,™ ThunderScan is Macintosh™ Plus and SE compatible, right out of the box. No wonder ThunderScan was recently voted "Best Digitizer/Scanner" in Macworld's first annual World Class Awards.

So if you want a sophisticated, high-resolution scanner and like the idea of saving money, the choice is as plain as the nose on your...well, you get the picture. Now get yourself a ThunderScan.

The Objective Type

Tip: Creating an attractive ad headline involves custom-fitting it to the allotted space by precisely adjusting its height and width. You can set headline copy with *MacDraw* and then import it into *PageMaker*.

Maker by cutting and pasting or by using *PageMaker*'s Place command. Once it's in *PageMaker*, you can stretch and pull this "graphic object" into the headline space as if it were rubber type. This strategy is OK

Rubber Text

From within *PageMaker*, *SuperGlue* lets you transform *PageMaker* headlines and text into graphics objects you can stretch or shrink to fit any space. Here an ad is shown in its original form (top left), with its headline elongated and body type the same size as original (top right), and with its entire contents stretched horizontally (bottom).

for simple headlines, but *MacDraw*'s kerning is inadequate and its line-space control is too primitive for multiline copy. A recent upgrade of *Glue* called *SuperGlue* gives you much more effective results without forcing you to quit *PageMaker*. Set the type in *PageMaker* with automatic kerning and custom leading so that it looks better than *MacDraw* type. Then "print" using *SuperGlue* to transform the *PageMaker* text into a graphic object. Copy and paste the object back into *PageMaker* with *SuperGlue*'s *SuperViewer* desk accessory. You can then enlarge, shrink, widen, or narrow the entire object.

This technique works as well on a whole ad as it does on individual headlines [see "Rubber Text"].

NOW THERE'S 3+ FOR MACINTOSH...AND ONE HALF OF CORPORATE AMERICA CAN TALK TO THE OTHER HALF.

A recent study* indicates the rapidly growing acceptance of the Macintosh by the business world.

Yet this is of little value to Corporate America if Macintosh users cannot communicate with and share the resources of existing IBM PCs, Personal System/2s and IBM PC compatibles.

That's why—because of 3Com's continuing commitment to total networking encompassing all standards, architectures and platforms—we've developed 3+ for Macintosh.

3+ for Macintosh is part of the 3Com 3+ family of network system software, Corporate America's most comprehensive, productive and popular networking system software.

While 3+ for Macintosh adheres to the new Macintosh standards, it's also the first operating software to integrate both Apple and IBM networking standards on the same server.

Meaning that both Macintosh and PC users can share and access files from each other's directories or folders when using programs such as Lotus 1-2-3, Microsoft Word, Microsoft Excel and Aldus PageMaker.

Workgroups can communicate between networks, whether they run on Ethernet, AppleTalk or Token Ring.

This means they can share the resources of servers and printers and enjoy the benefit of print spooling.

And best of all, workgroup members can communicate via the most sophisticated and productive electronic mail in the networking business.

3Com 3+ electronic mail gives workgroup members communication with other distant workgroups, remote access to the network and connectivity to MCI Mail and DISOSS systems via gateways.

There is no better way for Corporate America to connect its installed base of PCs and Personal System/2s to its newly acquired Macintoshes than with 3+ for Macintosh.

Because 3+ for Macintosh is part of the 3Com 3+ family of network system software.

And there is no better network software.

For your nearest 3Com dealer, call 1-800-NET-3Com.

*PC Tech Journal (August 1987) showed that 49.7% of readers who responded to a questionnaire felt that Macintoshes would be of importance to their companies in the future.

PC users can access and share files from Macintosh users' folders.

Macintosh users can access files from PC users' directories.

Getting Started with the New Mac System

Keeping up with the changing System Folder and matching the system to the Mac

by Jim Heid

My system should age as well as the Mac's. For me, the past year brought a stronger eyeglass prescription and occasional backaches—the rewards for writing by day and being a couch potato by night. For the Mac, 1987 brought new machines, faster performance, expandability, MultiFinder, and more. For the Mac at least, it was a very good year.

In *Getting Started*'s premier installment, we toured the Mac's System Folder and learned each player's purpose (see "Getting Started with the Mac System," *Macworld*, November 1986). But much has changed since the halcyon days of System 3.2 and Finder 5.3. Apple delivered two new Macs last April and has released three major system updates: System 4.0/Finder 5.4 in March, System 4.1/Finder 5.5 in May, and System Tools 5.0 in October. With its latest system release, Apple has assigned one version number to the whole package of system files. However, each file within System Tools 5.0 has retained its own version number as before (including the Finder, now 6.0). The new system files give Macs new capabilities, and the old standbys have evolved to keep up. This month, we ring in the New Year by revisiting our old acquaintance and its new contents. "System Folder Revisited" shows the icon, purpose, and latest version number of each player, as well as which version of the system Apple recommends for which Mac.

How To/Getting Started

An Expanding World

The System Folder owes its progress to three catalysts: last April's unveiling of the Macintosh SE and Mac II, the March christening of the *AppleShare* networking software, and the October release of Multi-Finder. The new Macs marked the shift toward hardware expandability but in the process introduced compatibility challenges. *AppleShare*'s ability to share a hard disk over a network required changes in the Finder. MultiFinder's approach to running multiple programs required changes in many files and brought with it an appetite for memory that has many people fuming on their way to buy upgrades.

But few would complain about the debut of expandable Macs. The SE's single system expansion slot and the Mac II's six Nubus slots let those machines house boards for color displays, IBM PC compatibility, increased speed, networking, and more. However, the birth of expandable Macs presented Apple with a challenge: maintaining software compatibility for all models, regardless of what expansion options they may hold. In the IBM PC world, users must often run software *installation* programs to tell other programs what kind of hardware they're using. To avoid imposing that chore on Macintosh users, Apple took the system files in a new direction: toward modularity.

The best place to see the modular approach is the Control Panel (accessed through the Apple menu) in System versions 4.0 and higher (see "The Old and the New"). Along its left side the Control Panel now boasts a row of icons, each corresponding to an *extension* that lets you set options for a particular device. The extension called General is used for the same basic settings the old Control Panel handled—the time, date, speaker volume, and so on. The Mouse and Keyboard extensions govern the mouse pointer's speed and the keyboard repeat rate. Mac SE and II users with more than one SCSI hard disk can use the Startup Device extension to tell the Mac which one to use when starting up. And Mac II owners can use the Color, Monitors, and Sound extensions to choose colors and adjust monitor settings, to specify the interaction between multiple monitors attached to one machine (for example, which windows should appear on

NOW AVAILABLE FOR THE MACINTOSH

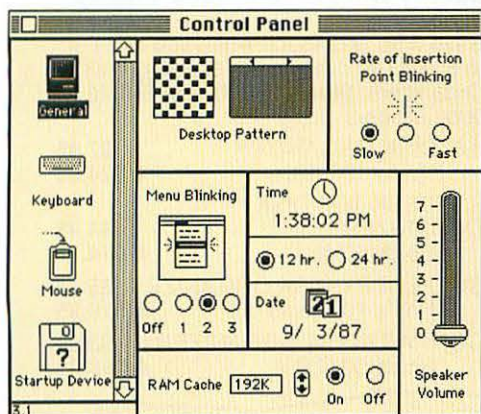

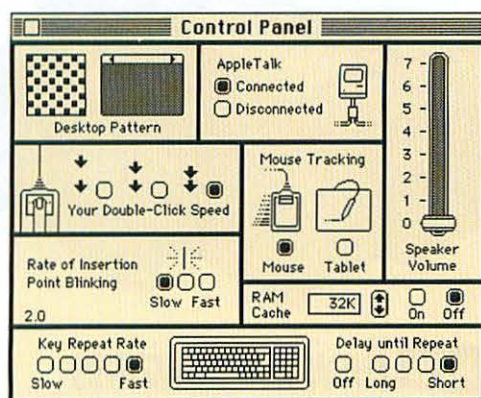

If your backup program isn't fast, you won't use it. Fastback for the Macintosh is the only program that can copy a full 10-Megabyte hard drive to standard floppy disks in less than 10 minutes! The minutes you save with Fastback may add up to hours compared to other backup programs.

Fastback is also the only program that uses advanced **error correction** techniques to recover data from damaged backup disks. And Fastback is **powerful** -- you can backup all your files, select folders and files for backup, or have Fastback select only the files which have changed. Fastback will even count up the disks you need and **print labels** for them.

Protect the data on your hard disk now. Remember, among those who use hard disks on their Macintosh systems, there will only be two types -- those who use Fastback, and those who wish they had! See your dealer today and ask for Fastback from Fifth Generation Systems, the leader in disk backup software.

*This is in no way associated with or has origination in Fisher Scientific or Allied Corporation. Macintosh is a trademark of Apple Computer, Inc.

How To/Getting Started

The Old and the New

In System versions 4.0 and later (bottom), the Control Panel uses cdev resources; each cdev controls a different aspect of the Mac's operation. When you open the Control Panel, it displays along its left edge any cdevs it finds in the System Folder. (Tip: to see who programmed the Control Panel, click on the version number below the icon list.) At top, the nonmodular Control Panel of System 3.2. The controls for AppleTalk have moved to the Chooser, while those for the keyboard and mouse are now in their own cdevs.

which screens), and to choose a digitized sound to replace the standard system beep.

Each extension is actually a separate System file called a *cdev* (pronounced *see-dev*), short for *Control Panel device*. When you open the Control Panel, it looks for cdevs, then displays the icon for each one it finds. Click on an icon, and the cdev swings into action, adding to the Control Panel's window whatever buttons and options are necessary for the device you chose. Thanks to cdevs, Mac II and SE users don't have to run cantankerous installation programs to add new hardware to their machines. Instead, users simply copy into the System Folder any cdevs that accompany the new add-ons and use the Control Panel to set up the new hardware.

Cdevs have other uses, too. A Mac II software package called *Colorizer* (Palomar Software, 619/727-3922) includes a cdev for adding color to menus, windows, and other on-screen objects. *QuickKeys* (CE Software, 515/224-1995) is a slick cdev that lets you add keyboard shortcuts to menu commands and type out lengthy text passages or even run applications with a single keystroke. Some free cdevs are available in the public domain through user groups and online services. One called *Cache II*, by Jan Eugenides, lets Mac II users improve compatibility by disabling the 68020's instruction cache, which can cause some pre-Mac II programs to crash. And for fun, try Mark Bennett's *Cheap-Beep*, which lets Mac Plus and SE users replace the standard system beep with digitized sounds, including *Star Trek*'s Dr. McCoy barking, "Are you out of your Vulcan mind?"

Apple is also encouraging application developers to use cdevs to add "preferences" features to their programs. With this approach, instead of choosing a Preferences command to specify your favorite working options, you would open the Control Panel and click the application's cdev. At this writing, no developers are using cdevs in this way, but several I've spoken with say they plan to.

DAs and Menus within Menus

Another example of the modular approach is the improved Key Caps desk accessory. Key Caps now requires a new system file called Key Layout, which contains the resource information Key Caps needs to replicate the keyboard layout for the Mac's four possible keyboards—the original, the Mac Plus keyboard, and the 81-key or 105-key Apple Desktop Bus keyboards for the SE and II. Key Caps also has a menu that lets you change the font in which the keyboard layout appears, a useful feature for locating characters in pictorial or symbol fonts.

Speaking of desk accessories (commonly known as DAs), today's system files also boast an improved Chooser, the DA you use to select printers and network file servers. Previous Choosers could display icons for only six devices, which might not be enough for a large AppleTalk network with many printers and file servers. Since the new Chooser lets you scroll through

How To/Getting Started

the entire icon list, you can now access as many devices as your network has.

A significant enhancement that debuted in System 4.1 is the ability to create *hierarchical menus*—menus within menus that appear when you drag down to the hierarchical menu's title and pause (see "A Menu's Menu"). Hierarchical menus give programmers more places to cram options without having to create gargantuan dialog boxes. A hierarchical menu can even contain its own hierarchical menus—like small boxes hidden within a larger one.

A Menu's Menu

System versions 4.1 and higher contain revised Menu Managers that can create hierarchical menus—menus within menus that appear when you drag to a hierarchical menu title and pause briefly. Shown here are the Text and Font menus from Target Software's Scoop desktop publishing program, one of the first applications to use the new menus.

Finding Common Ground

Besides new system files, each new generation of Mac has brought revised read-only memory (ROM) chips, whose software resides permanently in the Mac and creates menus, windows, and most other aspects of the Mac's personality. The 128K and 512K Macs contained 64K of ROM. The Mac Plus and the 512K Enhanced doubled that amount to 128K, and the SE and the II doubled it again, to 256K. Besides containing twice the software as the previous generation, each revision brings faster performance and more features. For example, the Hierarchical File System (HFS), which provides folders for efficient hard-disk management, debuted in the 128K ROM of the Mac Plus and 512K Enhanced. The Mac II ROM contains software for producing color displays and managing expansion slots. Both the SE and II ROMs

house improved text-editing routines; they also hold fonts that used to reside in the System file on earlier Macs.

But the problem with hot-rodding ROMs is that older machines might get left out in the cold, unable to run programs that require routines in the new ROMs. Apple's solution was to establish some common ground—a set of features and capabilities that developers could assume would be present in each generation of the system.

An Apple utility called Installer (included with the new system disks) creates this common ground. When you start Installer, you'll see a list of *scripts*—each tailored to a specific Macintosh model. Just choose the script you need, aim the Installer at a system disk, and you've brought that System Folder up to date. During the updating process, Installer *patches* the disk's System file, a job that involves adding the system routines necessary to create the common ground. When you start up an older Mac with a system disk that was updated for it, those routines (which are in ROM on the new machines) are loaded into an area of the Mac's memory called the *system heap*. That reduces the amount of free memory available, but enough remains to run most programs. The benefit is that, despite four years of evolution, the Macintosh family remains remarkably compatible.

But not completely compatible. The 128K ROMs do so much more than their 64K ancestors that patching all the needed routines into memory would leave little room for running programs. For that reason (and because of the Mac Plus's popularity), many software developers are abandoning 64K ROMs and crafting their wares for machines having 128K or larger ROMs—in other words, for the Mac Plus and its descendants. If you have a 128K or an unenhanced 512K Mac, it's time to consider upgrading if you want to run the latest programs.

Lost in Finders

Indeed, you'll *have* to upgrade to at least a 512K Enhanced to run the latest system software, System Tools 5.0, and

(continues)

Win \$5,000 with Bermuda Square™

Solve the Bermuda Square puzzle and you could win \$5,000 from XOR. If you're the one who can fit the 24 different sized squares into the one larger square, you could be the winner.*

Based on this mathematical formula of $1^2 + 2^2 + 3^2 + \dots + 24^2 = 70^2$, it's the puzzle of the century. Operating on your IBM PC, PC-XT, PC-AT, or their compatibles as well as the Apple Macintosh, **Bermuda Square** brings you hours of puzzle-solving fun.

Pick up your copy of **Bermuda Square** at your local computer store today. Or call 1-800-635-2425 TOLL FREE. And be sure to check out **NFL Challenge**®, **PRO Challenge**™, **Basketball Challenge**™, and **Oligopoly**™ examples of some other First Class Software from XOR.

* Write XOR Corporation for complete contest rules.

you'll need the full Mac Plus upgrade to run MultiFinder. MultiFinder represents the Mac's first, wobbly steps toward *multitasking*—which enables you to run multiple programs simultaneously or work in applications while the computer performs time-consuming tasks, like printing or telecommunications, in the background (see "MultiFinder: The Application Juggler," *Macworld*, October 1987.) But because of the extra system software required to keep multiple programs from bickering over each other's bytes, MultiFinder craves memory like I do DoveBars. If you're upgrading to a Plus and you want to use MultiFinder to work with multiple applications, you'll need at least a second megabyte of RAM (random access memory—the temporary workspace in which applications run)

I usually perform only one task at a time, and I enjoy taking a break while my Mac and printer converse, so MultiFinder is of little use to me. But its cohort, Finder 6.0, does have a place in my System Folder. Finder 6.0 is the third Finder to appear this year. The first, Finder 5.4, was released along with Apple's *AppleShare* file-server software, which lets members of an AppleTalk network share hard disks attached to a Mac Plus or another IMB Mac (see "AppleShare: Multifaceted Networking," *Macworld*, March 1987, and "Getting Started with Networking," *Macworld*, September 1987).

When *AppleShare* is running, Finder 5.4 and its descendants recognize it and add a Get Privileges command to their File menus, which lets network members specify how their own files and folders can be accessed by others. The new Finder's disk windows also reflect the network's design, with icons showing who can open and modify folders. By making the Finder "*AppleShare* aware," Apple created a networking product that blends into the Mac environment better than any other.

The Finder's other improvements range from cosmetic to convenient. The Trash Can bulges when it contains something. Two Get Info windows can appear side by side, which is handy when you're comparing two files to see which is the most current. A Restart command debuted in the Special menu, and the workings of the Shut Down command changed. Shut Down now uses a new system routine

called the Shutdown Manager. On a Mac II, the Shutdown Manager turns off the computer. On other Macs, it displays a dialog box that gives you the option of shutting off the Mac or restarting it. The Clean Up command has some new permutations that let you selectively clean up icons. And a slick shortcut appeared: press the Option key while dragging a file into a different folder and the Finder puts a copy of that file in the folder, rather than moving the original.

Finder 6.0 shares these refinements and adds its own. The dialog box that appears when you copy files contains a Cancel button and conveys more information, showing which file is currently being read or written, while a little bar graph shows the Finder's progress as it copies multiple files. The About the Finder command shows how much memory is available; when MultiFinder is running, you'll also see how much memory is consumed by each open application. On Mac IIs, a Color menu lets you choose a color for an icon or a folder. The Set Startup command now lets you specify whether to use MultiFinder, and if so, whether it should open any applications upon start-up.

More Power to the Printer

The printer drivers have been remodeled too. The 4.0 versions of the PostScript printer drivers, LaserWriter and LaserPrep, were roughly twice as fast as their version 3.0 counterparts, and they offered several new options. You can specify that a page be flipped vertically or horizontally, or inverted (black becomes white, and vice versa). These options work especially well with Linotronic PostScript typesetters. By loading the typesetter with film instead of the more commonly used opaque photographic paper, you can create the film negatives and "wrong-reading" images (which appear backwards when viewed from the light-sensitive side of the film) that many printers require.

Another LaserWriter print option, Larger Print Area, lets you print closer to the edges of a page by stealing printer memory usually reserved for holding downloadable fonts. Finally, there's an op-

Would you buy a big screen with your eyes closed?

In 1986, there was one dual-page display for the Macintosh™ computer: ours. The choice was simple. Now, it seems, everybody and his dog makes one. So it gets confusing when you're shopping.

To make matters worse, there are very few places you can sit down and compare big screen displays.

But you don't have to buy "blind." Our MegaScreen™ gives you advantages we can demonstrate here.

WYSIWYW (What You See Is What You Want).™

Other big screens give you a compressed display, showing 82 or even 94 dots per inch (d.p.i.). That means 10-point type looks like 7-point type. It's just too small to read comfortably.

There is a big difference between big screens.

75 x 75 d.p.i.	Laser Output	82 x 82 d.p.i.
-------------------	-----------------	-------------------

If you want your big screen to show accurately what will be printed, you need our 75 x 75 d.p.i. resolution.

ably. MegaScreen lets you select screen resolutions. For example, when you work with graphics, you'll want accurate proportions. Our 75 x 75 d.p.i. resolution displays sizes and shapes perfectly. When you work with a big spreadsheet, select maximum resolution: 75 x 87 d.p.i. (1024 x 900) and get even more data on the screen. You control it all with a menu.

There are one and two-page MegaScreens

for the Macintosh SE and Macintosh II. Interface cards are dealer-installed — typically in less than 10 minutes — without voiding the Apple® warranty. MegaScreens are also available for the Macintosh Plus.

We remember the future.

With an SE, we know you're giving up your slot by adding an interface card, so we've provided options. You can choose a card with a 68881 math co-processor, or you can select our modular card, which provides its own 'slot' for our MegaModules, such as a video

output (NTSC, PAL, and standard Macintosh signal).

Unlike some big screens, we even give you options for your original Macintosh screen: it can work in tandem with your MegaScreen to extend your work space. Or, if that's not useful to you, we have something that will be: it's called MegaTalk. It's included in our Video System and lets you communicate with one or more users through your AppleTalk® network. Even while running other applications.

Someday, other big screens may give you the control, the options

MegaScreen 2001 lets you display 300% more data than the Macintosh II monitor.

and the additional communications features MegaScreen Video Systems offer.

But if you need the increased productivity today, you can clearly see there's only one choice.

tion that eliminates the slight distortion that often plagues printed bit-mapped (MacPaint-type) graphics because their 72-dot-per-inch (dpi) resolution isn't an even multiple of the LaserWriter's 300 dpi. To resolve this problem, the Precision Bit-map Alignment option reduces the entire page by 4 percent. The latest PostScript drivers, versions 5.0, provide these same niceties and work with MultiFinder as well, so you can issue a Print command and then jump into another job while the drivers get the printer going in the background.

The past year also saw new versions of the ImageWriter drivers that offer improved print quality in the Best mode and also fix miscellaneous bugs. And a new print driver, ImageWriter LQ, is shipping with the ImageWriter LQ printer.

Odds and Ends

Other enhancements to the System Folder may not be as significant as Multi-Finder, but they're noteworthy nonetheless. Easy Access is an Init file that provides two keyboard-modification features. (Init files contain small system-modifying routines that the Mac executes upon start-up. For a more detailed explanation of Inits, see "Getting Started with Desk Accessories," *Macworld*, October 1987.) One called Sticky Keys, which makes the keyboard more accessible for the handicapped, goes to work when you press the Shift key five times. When Sticky Keys is active, you can use combination keystrokes (such as ⌘-S , or Shift-Option-) without having to press two or more keys simultaneously. Instead, you press one after another: first the modifier key or keys (⌘ , Option, Shift, Control), then the character key. Easy Access's other feature, obtained by pressing ⌘-Shift-Clear , is called Mouse Keys. It lets you move the pointer using the keyboard's numeric keypad (see "The Pointer's Keys"). It not only makes single-pixel positioning a cinch, it could be a god-send if your mouse dies while you're on deadline.

It should be obvious that updating your System Folder is the least expensive way to improve your Mac. The latest system software is available free from user groups, online services, and Apple dealers. (If you

Free at last.

The liberation of fonts and desk accessories is now at hand. Suitcase™ allows unlimited access to fonts and DAs—and they don't have to be installed in your System file.

Imagine having fifty or more of your favorite DAs in your Apple menu. Or, if you're involved in desktop publishing, how about three hundred or more fonts at the ready?

Having unlimited access to every font and DA means always having the right tool at your disposal.

Now that's freedom.

Compatible with MultiFinder.

Even the most sophisticated desktop publishing system is incomplete without VeloBind.

Don't let your desktop publishing stop at the printer.

Complete it with VeloBind, the only binding solution that transforms the promise of desktop publishing into reality. VeloBind provides the crucial, finishing touch to desktop publishing by turning any printed material into impressive, authoritative documents. Desktop publishing that increases your document's chances of being noticed, read, and accepted.

Only VeloBind allows you to "publish" your desktop publishing

in a library-quality hard cover. In under a minute. Or choose from a wide variety of soft cover materials and colors. Even without a cover, desktop publishing bound with VeloBind looks more professional.

All on your desktop.

VeloBind binding systems are compact, fast and easy to operate. Binding that complements your desktop publishing and creates a positive reflection on you. So do yourself — and your desktop publishing — justice. Visit your local computer or stationery store today or call us for more information. Or stop by your local copy shop and use their VeloBind system to

complete your desktop publishing.

Because, after all, your desktop publishing is just a stack of paper until it's bound. With VeloBind.

VeloBind®

The desktop binding for desktop publishing.

The Pointer's Keys

The Mouse Keys feature of the Init file Easy Access lets you move the mouse pointer using the keyboard's numeric keypad. To activate Mouse Keys, press **⌘-Shift-Clear**. Subsequently, the numeric keys move the pointer as shown here. The longer you hold down a key, the faster the pointer moves; tapping a key moves the pointer one pixel at a time. Pressing the 5 key is equivalent to clicking the mouse button; pressing 0 is like holding down the mouse button, while pressing the period key is like releasing it. To deactivate Mouse Keys, press the keypad's Clear key.

want documentation, you can buy Apple's official update package through a dealer for \$49.) But before you double-click on the Installer, make sure your favorite programs are compatible with the new system, especially if you use system-intensive software such as network file-servers or spoolers.

The Mac system has improved considerably since the days when you risked a crash if you attempted to store more than 150 files on a hard disk. Today's System files offer more speed, features, and reliability than their predecessors, without sacrificing the Mac's easy operating style. And with more expansion options, closer ties to other computers, and still more system improvements on the horizon, 1988 promises to be a banner year.

As for me and my New Year, I'm not making any promises. The only resolution I'll see in 1988 is 72 dots per inch. □

**It took Michelangelo
four years to complete
this masterpiece.**

**Linda Wilson did it
in seconds.**

You no longer need to be an artist to create a work of art. All you need is a Princeton scanner. It makes even the most complicated desktop publishing jobs quick and easy. And for what it could cost to create one piece of original artwork, you can own an LS-300F or LS-300 scanner.

Of course, Princeton scanners are IBM PC and PS/2 compatible. And with a Mac Scan™ interface they work equally well with your Apple Macintosh II, Plus or SE. Just make a simple connection and you're ready to go.

Place any original — whether it's a small or large photo, cumbersome book or irregularly-shaped graphic — on the Princeton LS-300F Flatbed Scanner and scan it into your system almost instantaneously. When viewing it on your monitor you'll be amazed at the exceptional clarity that our 300 DPI resolution and gray scales provide.

On the other hand, if you don't need to work with cumbersome originals, our cost effective LS-300 Roll Feed Scanner will leave you with the same image of perfection. Both the LS-300 and LS-300F can be used with PC systems that utilize CGA, EGA or monochrome displays. Or team it up with the Princeton LM-300 or LM-301 Monitors, to allow you to view full page visual effects before printing. An optional trainable OCR software package enables your PC to read and store typewritten pages.

We include PC Paintbrush Plus software (a \$149 retail value) with the purchase of each Princeton scanner. PC Paintbrush Plus lets you create image files compatible with Ventura Publisher, PageMaker, etc. for professional quality drawings, diagrams, charts, graphics and headlines. Use your mouse, joystick or digitizer to manipulate the image and create precisely the effect you want. That means you can crop it, reduce it, enlarge it, and of course preview it before anything appears in print on your laser printer.

The next time you need a masterpiece, don't worry. With your Princeton scanner you can create one. For more information contact us at 601 Ewing Street, Building A, Princeton, New Jersey 08540 (609) 683-1660. And gain the visible edge.

LS-300F Flatbed Scanner \$1595

The LS-300F is compatible with IBM PC/XT/AT PS/2-Model 30 and Apple Macintosh II, Plus or SE.

LS-300 Roll Feed Scanner \$1095

The LS-300 is compatible with IBM PC/XT/AT PS/2-Model 30 and Apple Macintosh II, Plus or SE.

Switching to HyperCard—you can take your data with you

by Danny Goodman

It's incredibly difficult to get people to switch from familiar applications. Not only is there the comfort of knowing your way around a particular program, there is often a considerable investment of time in data entry, especially with database applications. My number-two computer nightmare (after disk failure of any kind) is reentering data. I type nearly 100 words per minute not because I like typing, but because I want to get it over with as quickly as possible.

If you've already built up a considerable database of names and addresses, for example, you'll need strong incentive to port it over to *HyperCard*—more than just knowing that *HyperCard* performs full-text searches blindingly fast and can link to other data-intensive applications. You'll want your database to transfer itself magically to *HyperCard*. If that's the case, well, have I got a *HyperCard* button for you.

Before we get to the magic inside this button, however, it's helpful to understand a few fundamentals about Macintosh files and file transfers. This knowledge should come in handy for any kind of data transfer.

The Nature of Macintosh Files

Nearly every Mac application stores its document data in a format unrecognizable by other kinds of computers. This is especially true of files containing information like textual enhancements and graphics, which other computers cannot handle. But even within the Macintosh realm, some programs store information in ways that other programs don't understand; word processing programs, for instance, are notorious for doing this. Only the early popularity of *MacWrite* has made it possible to pass formatted documents from, say, *WriteNow* to *Microsoft Word* via file translation routines (which are a separate program in

WriteNow but an integral part of *Word*).

Since text created in a Macintosh application must often be shared not only with other Mac programs but with IBM PCs or mainframe computers, there is a *lingua franca* that virtually all computers can understand called ASCII text. ASCII is a standard code system developed by the computing industry to facilitate text transfer. The code number 65 represents the uppercase letter A in ASCII. As long as two computers understand that, files may be passed between them.

Most Macintosh programs can accept ASCII text files as well as write them. That's what the Text Only choice means in the dialog boxes that let you save documents (see "The Many Faces of Export"). To accommodate this lowest common denominator, however, programs strip all formatting—like tab locations, boldface, and so on—from the file. Only the raw characters go to an ASCII disk file. When two programs cannot accept each other's own

coded files, an ASCII text-file transfer is about the only route left.

For a complete transfer you must export information from one program to a text-only file and then import it to another program (see "Importing Intermediary"). Once the characters are in the document of the second program, you can save the text and any formatting you add in that program's preferred file format.

Database Files

If you follow the directions most database programs provide to set up a name-and-address database, your file probably consists of one field for each kind of information—one for name, one for company name, and so on, including separate fields

(continues)

The Many Faces of Export

Not all database and spreadsheet programs adhere to the same methods for exporting their proprietary encoded data to a text-only format. Here are the interfaces for four popular

products and the settings you should use to export data for the Import button: *Microsoft Works*, *Microsoft Excel*, *Omnis 3*, and *Double Helix*.

Microsoft Works

Works provides an Export Data check box to save a database as an ASCII file.

Microsoft Excel

Choose the Text format for exporting an Excel database. Excel places a tab character between columns and a carriage return at the end of a row.

Omnis 3

Omnis 3 not only gives you more format choices, but it also lets you select individual fields and specify their order for the exported text file.

Double Helix

Double Helix is very flexible, offering choices of any ASCII character for database start character (none is required for the Import button), field separators, and stop character between records.

for city, state, and zip code (see "Conventional Contacts"). Each form is called a record. For databases, it makes sense to break down information into tiny field elements and records because then you can sort according to any field or select records meeting search criteria for one or more fields.

The tradition in Macintosh file exporting has been to place a tab character between fields and a carriage-return character between records. Even if a field in a record is empty, the export facility puts a tab in the file so that all records appear to have the same number of fields. Not coincidentally, this is the same format that spreadsheet programs such as *Microsoft Excel* use to export columnar data. When writing a spreadsheet to a text-only file, *Excel* places a tab character between cells in the same row and a carriage return at the end of a row.

Omnis 3 and *Double Helix* offer additional flexibility for exporting data. *Omnis*, for instance, provides five methods for formatting text. *Helix* goes much further, by offering a list of all possible characters that you may wish inserted between fields and records. The default settings are HT (horizontal tab) between fields and CR (carriage return) between records.

Data from each record's fields are stored on disk in the order in which the fields were created. Thus, in *Microsoft Works*, if you create a database form and modify the order of the fields, the original order (field 1, field 2, and so on) remains in force, even though the tabbing order of the fields adheres to a sequence of top-left to bottom-right in the entry form. If the receiving program expects the data in a certain order, you must be sure to have your fields set in that sequence.

What HyperCard Wants

Unlike the typical database record, which contains many fields, the Address stack card in *HyperCard* has only three fields. Of these three, only two contain name, address, and phone data (see "A Stack of Contacts"). The first is a seven-line field, which (if you follow the format of the card as you received it) holds all name and address information. The second field holds the phone number. The third field, at the lower-right corner, is reserved for the stack: it's where the current date goes whenever you update information on a card.

(continues)

These unretouched print samples show the superior print quality of QMS-PS 810 over printers using first-generation print engines.

Introducing the PostScript laser printer that blacks out at high speeds.

The new QMS-PS[®] 810 can compose and print the most complex pages in record times, with richer, more saturated blacks than ever before. All with the desktop publishing power of Adobe PostScript[®], and the superior print know-how of QMS, an industry leader.

Under the hood QMS ASAP[™] (Advanced System Architecture for PostScript) is proprietary technology that helps eliminate the hardware bottlenecks that hinder other PostScript printers. As a result, QMS-PS 810 boasts processing speeds remarkably faster than other PostScript printers in its class. And faster output means greater productivity. In addition, the QMS-PS 810 laser printer's new Canon[®] SX[®] print engine covers solid areas and prints fine detail better than previous-generation engines.

Fast start, strong finish You can adorn your documents with one or all of the 35 Adobe typefaces. Thanks to PostScript, there's an infinite number of font variations available. You can also make type as large or as small as you want. And put it anywhere on the page. In fact, with PostScript you enjoy total control over the design of your page. It gives you the complete desktop publishing power to do things that would otherwise be virtually impossible. So you get high-quality output exactly how you want it.

Along with PostScript, the HP LaserJet⁺[™], Diablo[®] 630 and HP-GL[™] printer emulations are added for your non-PostScript software.

The QMS-PS 810 laser printer is easy to use, maintain, and comes with a one-year warranty. It's available from Laser Connection dealers. Laser Connection is a sales and marketing subsidiary of QMS. For the dealer nearest you call **1-800-523-2696**.

Circle 720 on reader service card

A Stack of Contacts

This HyperCard stack puts the name and address in one field and the phone number in another. The script activated by the Import button converts files from a database to this form.

So in this case importing a database text-only file involves first reading the data and then combining data from several fields into HyperCard's two fields. To that end, the script attached to the Import button featured here assembles name and address database fields into a single field in the HyperCard Address card; the phone number database field goes into the HyperCard phone field by itself. For demonstration purposes, I assume a starting database form that looks like the one from

Works in "Conventional Contacts." Even if your database is set up differently, you'll need to make only slight modifications to the HyperCard Import button script to make it work.

Making the Import Button

Listing 1 contains the script for the button. To create this button in your Address stack, first make sure the User Level (in the User Level card of the Home Stack) is set to Scripting. Then go to the Address stack and choose New Button from the Objects menu. A new text button appears in the middle of the screen, preselected for you to drag to an unused area of the card.

Double-click on the button to see its Button Info dialog box. Type the name *Import* into the button name box. Then click the Script button. In the button's Script Editor box, you'll see the opening and ending lines of the script already entered, with the text pointer flashing between them. Type in the script as shown in Listing 1.

What Makes the Button Tick

To help you understand the script so you can change it to suit your purposes,

here's a description of the *HyperTalk* commands, starting at the top. This button's script is set in motion when you click the Browse tool atop the button. The first thing that appears is a dialog box requesting the name of the file you wish to import. *Transfer Text* is supplied as a default file name. If you use that name when exporting your database data to a text file, you don't have to type anything into the dialog box; just click OK. (The file to be exported must be exposed in the window of the active disk—not hidden in a folder—for HyperCard to find and open it.)

The script places the file name you specify into a local variable, called file-Name, and opens the file so that it can be read by HyperCard. Then the script sends you to the last card of the stack, where new cards will be added.

Repeatedly Reading

The balance of the script is a series of instructions that the program repeats until the script receives the signal that all importing is complete. The mechanism that stops the importing is within this repeat loop, so

Try the new quadLYNX Trackball.

A precision cursor control device in a space saving ergonomic package designed by Honeywell Corp.

quadLYNX trackball is very much like an upside-down mouse. Instead of rolling the mouse on a table top, you roll the ball with your fingertips, thereby moving the cursor on the screen.

quadLYNX handles **all** the same software you have been feeding your mouse.

quadLYNX is versatile, reliable and easy to use, it has an automatic acceleration feature that senses the speed of the ball, when you move the ball faster, the cursor moves further. Also, the "lock" button makes many applications easier to use!

The PostScript laser printer sure to get high ratings at its network debut.

The new 8-page/minute QMS-PS 800 II laser printer

The QMS-PS® 800 II is an 8-page-per-minute laser printer that combines the desktop publishing power of Adobe PostScript® with the superior printer technology of QMS, a leader in printer technology for 10 years. Exceptional paper handling, faster processing speed and a Canon® CXD® print engine with 10,000-page-per-month duty cycle give QMS-PS 800 II the versatility your Macintosh™ network needs.

A network sensation QMS-PS 800 II holds 500 pages, so operators aren't constantly refilling depleted paper trays. Users can even designate automatic switching between the two trays for doing letterhead/second page printing. Select faceup or facedown collation. And manually feed odd-sized paper stock.

With QMS ASAP™ (Advanced System Architecture for PostScript) proprietary technology, QMS-PS 800 II delivers outstanding performance. In fact, the more complex the page, the more it outperforms other PostScript printers. Two megabytes of memory, expandable to three megabytes, also add to the overall page processing speed when you are creating complex documents.

Type casting The QMS-PS 800 II comes with 35 resident typefaces (you can download more if you like). PostScript allows you to scale type to virtually any size, from minuscule to mammoth. PostScript also enables you to design, and redesign, your documents with exacting detail. You have total control over the final appearance of documents, with the ability to place text and graphics anywhere on the page. In short, you get the complete desktop publishing power that only PostScript can give you.

Critical acclaim The QMS-PS 800 II is certain to receive rave reviews on your network. And for a single-user set-up, there's the QMS-PS 810 laser printer. For a demonstration of either, call **1-800-523-2696** for the location of the Laser Connection dealer nearest you. And be sure to ask for *The Sourcebook*™ – our exclusive catalog filled with the latest laser printer products and enhancements.

**LASER
CONNECTION™**
A QMS® Company

there is no danger of getting into an "endless loop," even though the beginning instruction makes it sound as if it will go on forever.

First comes the creation of a new card to receive the first batch of imported text. Then comes another repeat construction nested within the previous one. This repeat loop reads the first seven database fields into memory one at a time and places them in appropriate locations in the Address card's first field. For instance, the first time through the loop, *HyperCard* reads information from the text-only file until it finds a tab character, which signals the end of the first field (in this case, *name*). Next, the tab is removed. As long as the first database field is not empty (if it is, that means there are no more database entries to be read and, therefore, the importation should end), the information just read into memory is placed in the first line of Address card field 1. The second item goes into line 2, and so on, from the first field to the last.

HyperCard encourages you to set up your Address stack in a more common format: city, state, and zip code on the same

Works Database (DB)	
Name	Lynne Torres
Company	Micro Products Group
Address 1	P.O. Box 400
Address 2	4200 County Line Road
City	Concord
State	CA
ZIP	94520
Phone	415-555-9080

Conventional Contacts

In a database of contacts, each piece of information goes into a separate field, as in this Microsoft Works file. *HyperCard*, however, typically groups several fields together, so they must be combined during conversion to *HyperCard* to arrive in the right form.

line (with a comma separating city and state). Therefore, the button's script treats specially the placement of the state and zip code data. For the sixth item (the State field), the script places a comma, a space, and the state data *after* the last entry to field 1, the city. The Put After command does not insert a carriage return. The zip

code is similarly placed a couple of spaces after the state.

Now there's only one item left in the first database record, the phone number. As the last item, it's followed in the text file not by a tab but by a Return character. Thus, the script reads data from the file until it encounters a Return character and places the phone number into the Address card's field 2.

Using the Import Button

When you import data from some databases, you may find the first card holds the database structure instead of a record. A Works database text file, for instance, includes as the first record the names of the fields where the data normally goes. If you see this odd-looking card, simply delete it (**⌘-Backspace** is the shortcut).

Also, this button script assumes that your database has two address lines. Database records with a blank second-address field leave an empty line in the *HyperCard* Address card. If that blank line bothers you, remove it just as you'd remove an extra line in a word processing document.

Give your HP LaserJet the desktop publishing power you thought it had.

PS Jet & PS Jet + PostScript upgrade kits

It can be frustrating to realize your HP LaserJet™ falls short of true desktop publishing capabilities. A PS Jet™ or PS Jet+™ upgrade kit from Laser Connection lets you correct that shortcoming. These upgrades incorporate the advanced print technology of QMS, Laser Connection's parent company, with 10 years' experience in developing print system technology.

Each upgrade kit adds the power of the Adobe PostScript® page-description language, the accepted standard for desktop publishing. They're the only such upgrades available for the HP LaserJet and other laser printers that use the Canon® CX® engine—Canon, NCR,™ QMS, Talaris, CPT, and more.

Master a new language PostScript gives you the ability to exploit the full potential of desktop publishing. It takes you far beyond mere word processing to give you total control over the final appearance of your documents. Place text and graphics anywhere on the page. Design and redesign every detail to your liking. The end result is the high-quality output that you require.

In addition to PostScript, you'll get 13 resident typefaces with PS Jet, and 35 with PS Jet+. Should you want more, we throw in plenty of downloadable font space. Thanks to PostScript, there's an infinite number of font variations available. And every typeface can be printed in sizes from one point to as big as the page and beyond.

A transfer of power All it takes to replace your LaserJet's top cover assembly with the PS Jet or PS Jet+ is a screwdriver (included) and about an hour of your time. Each comes with HP LaserJet+,™ Diablo® 630 and HP-GL™ printer emulations for your non-PostScript software.

Simply put, PS Jet makes your HP LaserJet better *and* protects your initial investment. Call **1-800-523-2696** for the location of the Laser Connection dealer nearest you.

And be sure to ask for *The Sourcebook*™—our exclusive catalog filled with the latest laser printer products and enhancements.

Listing 1

The Import button script retrieves database information saved as a text-only file. Transferring

data from a database program to HyperCard needn't entail retyping.

Modifying a Database to Fit

I noted earlier that the field order of some databases cannot be altered. For instance, if you create a name database like the one in "Conventional Contacts" but forget to add the Company Name field until the end (and insert it manually near the top of the form), that field will go into the export file last—something you don't want to happen.

To modify the field order, first save the database as a text-only file. Open that file within a spreadsheet program and cut and paste the columns so that they're in the desired field order. Finally, save the spreadsheet file as your Transfer Text file. When the Import button opens this file, the data will be in the correct order.

You no longer have an excuse for not trying out your card-file databases in HyperCard. Let me know how it compares to your trusty database for quickly looking up addresses and phone numbers. □

Insights on Adobe Illustrator

Tips for the path to proficiency

by Bruce Maurier and Kevin Rardin

Adobe Illustrator hit the drawing and drafting market with a splash a year ago. Though the program takes considerable time to learn, the professionals who have invested the effort to master it find that effort paying off daily in their publishing and graphics production tasks. Both of us are among the converts. After months of experimentation—and headaches—we've settled on *Illustrator* as the best tool for any kind of line art in our electronic publishing businesses.

Anyone familiar with the most popular Mac graphics programs sees immediately that *Illustrator* is a world apart. But much about the program's operation is not immediately obvious. Through working with the program on a daily basis and constantly referring to Adobe's complete but rather oblique manual, we have uncovered the techniques detailed here. We assume you have a basic understanding of *Illustrator*; but these tips will aid the casual user as well as the graphics professional who every day produces technical, marketing, or advertising line art.

Thanks to David Smith of David Smith/Design, Sausalito, California, for pointing us in the right direction.

The Driver's Seat

Illustrator's keyboard commands and mouse modes can put you in the driver's seat at your electronic drawing board. Until you gain proficiency in these keyboard shortcuts, working with *Illustrator* may seem frustrating and awkward compared to using traditional tools. When you are drawing with pen and ink, you just reach for a tool and draw with it. Similarly, with *Illustrator*, you can draw with the Pen tool, then press the ⌘ key and instantly reposition an anchor point to redraw a line. Or

you can press the option key and the spacebar together, point at part of the page, and zoom in at 200 percent increments. You can't do that with pen and ink.

Study the shortcuts listed here and on *Illustrator*'s Keyboard Summary Sheet and experiment with them (see "Keyboard Shortcuts"). With your left hand on the keyboard and your right on the mouse, the only thing missing is an accelerator pedal.

Joining Together

If you want to Join (⌘-J) the ends of two paths exactly, remember to Average (⌘-L) them first. The two points may only *appear* to be in the same place, separated by a pixel or two. Later when you scale, rotate, or reflect the figure, that little discrepancy can become a big headache. To avoid the problem, zoom to 800 percent, bring the two paths together until they touch, and then move them a bit closer so that they overlap by one little jump of the line

(continues)

JOHN HERSEY

Press spacebar with any tool selected to select Hand Tool.

Press Command key at any time to access selection pointer.

Press Command key and spacebar together to access zoom-in pointer.

Press Option key, Command key, and spacebar together to access zoom-out pointer.

Press Option key and Command key together with selection pointer (controlled with mouse) to select a complete path.

Press Shift key and Command key together with selection pointer to move whatever you're pointing at while constraining that motion to 90 and 45 degree angles.

Keyboard Shortcuts

Keyboard commands make short work of even painstaking Illustrator procedures. Here is a handful of invaluable shortcuts that accelerate the drawing process.

on your screen. When selected, the two anchor points should look like one—not one and a half. Now joining the two paths should not trigger that latent migraine.

Cutting Asunder

The Scissors tool chops circles, ovals, rectangles, and squares into the pieces needed for a drawing. You must ungroup (\mathbb{H} -U) the shapes before cutting them with the Scissors.

For example, if you need a box with rounded corners, you might go nuts trying to do the job with the Pen tool. Instead, hold down the Shift and Option keys to draw a circle (from its center) with the same curve in one of its quarters that you want at the corner of your box. Ungroup the circle. With the Scissors, clip the circle's four anchor points to produce four equal quarter-circle arcs. Move the arcs apart, using the Shift key to keep them aligned. Now it's easy to connect the corners with the Pen to complete the box. If you want to specify in points exactly how far away the arcs should move, select two adjoining arcs using the Option key and the marquee. Holding the Option key down, select the pointer from the tool palette, type the number of points, and select Horizontal or Vertical. (Use positive numbers for right or upward movement, negative numbers for left or down.) Then move the third arc following the same procedure and connect all four arcs with the Pen to finish the box.

The Key to Alignment

When you begin using *Illustrator* for work that requires careful alignment, you quickly discover the program has no system of grids or guides that you might expect from other Mac graphics programs. Having committed to *Illustrator* for your project with no time to look back, you might think you'll just have to align everything by squinting—and by keeping a very steady hand on the mouse.

The manual's index and glossary suggest that alignment is something to do only with type. And even though you may have read everything the documentation has to say about constraint, experimented with

the Shift (Constrain) key, hit \mathbb{H} -K, and sniffed warily at the Constrain dialog box, somehow the word *constrain* fails to convey alignment.

In fact, the secret to alignment is mastering constraints. When you hold down the Shift key during a movement in *Illustrator*, you force, or constrain, the object you are moving to follow one of eight exact paths. It is as though you are creating an invisible grid when you hold down the Shift key. In combination with the Option key and Transform Again command (\mathbb{H} -D), you can use this invisible grid to solve most of the toughest alignment problems.

Consider a simple order form (see "An Orderly Approach to Alignment"). With no apparent grid, and only the aid of the rulers at the edge of the drawing area, aligning the eight elements would appear to be more trouble than it's worth.

Items Ordered:

Items Ordered:

An Orderly Approach to Alignment

By leaning heavily on *Illustrator*'s Constrain option, you can easily create, move, or copy items in perfect alignment, whether for forms or for drawings. Here, an orderly form emerges in seven easy steps, as described in the text.

Actually, you can easily align everything in the form with the first object you create, without ever resorting to the remote rulers. To make a form as in the example, first enter the left-aligned text, *Items ordered*:. With the Pen tool, click one to set an anchor point directly on the anchor point of the text block. While holding down the Shift key to force the new path to follow *Illustrator*'s preset axis of constraint, set the other end of the path horizontally to the right to draw the first line of the form.

Now Option-click to select the line, and then drag it away from the text. After the line begins to move, press the Shift key again to put it under the power of the invisible grid. When the line is in place, release the mouse button and then the Shift key. To position the line a specific number of

points below the baseline of the text, instead of dragging it hold down the Option key and click on the pointer tool. Then specify in the dialog box how many points away you want the line to go—horizontally, vertically, or at an angle (see “Moving Pictures”). Use positive numbers to go right or up, negative numbers for left or down.

Moving Pictures

For precise positioning, use Illustrator's dialog boxes to specify exactly how much—in points or degrees—to change an object. This Move box appears when you select an object and then hold down the Option key while clicking the pointer in the tool palette. Similar boxes appear when you select a transformation tool and then hold down the Option key as you click the object at its transformation point.

With the line still selected, move it down again. But this time press Option along with Shift and then release the mouse button to place an exact copy of the first line below. (If you use the dialog box for the move, click Copy instead of OK to obtain the same result.)

With the second line still selected, press ⌘-D (Transform Again, on the Arrange menu) to create another copy perfectly aligned with the other two lines and the text above.

Now select all four elements, either with the marquee or by pressing ⌘-A (Select All). Click on any element and drag the entire cloned group to the right. Once the group begins to move, press Shift to hold the elements in perfect horizontal alignment with the original. When the group is in position, press Option (in addition to Shift) to leave an exact copy when you release the mouse button.

Finally, deselect the copy by clicking on the background and select the text in the copy without moving it. The surest way

to do that is with the marquee—selecting an object in *Illustrator* with the pointer often moves it accidentally. Press ⌘-T (Type, on the Style menu) to bring up the Text dialog box. Type *Send to:* to replace the selected text. Don't change the type font, size, kerning, leading, or—most importantly—location. There is now no need for manual alignment. Everything has been aligned with the first element created, using only Shift, Option, and ⌘-D. Once you learn to keep the first, second, and third fingers of your left hand on the ⌘, Option, and Shift keys, the whole operation should take about 30 seconds.

The Angle of Repose

Illustrator's ability to make objects follow the eight horizontal, vertical, and 45-degree-angle paths would be merely useful if it weren't for the fact that the paths' orientation can be reset at any angle on the page (see “*Illustrator's Compass*”). A few words about adjusting the angle of constraint might be in order here.

There are two ways to change the orientation of *Illustrator*'s invisible grid. After selecting Constrain from the Arrange menu (or pressing ⌘-K), you can type the desired angle of the horizontal axis into the dialog box and all the invisible grid lines will rotate along with the horizontal axis, just like the example compass in the figure, always at 45-degree angles from one another. Typing a positive number rotates the grid counterclockwise; a negative number rotates it clockwise. The grid's new orientation stays in effect until you change it again—ready to go to work whenever you press the Shift key during the transformation of an object.

There is a second way to change *Illustrator*'s axes: create the line you want your customized invisible grid to follow. You can establish a new axis either by selecting two points of an existing straight line that has the correct angle or by selecting two anchor points in the drawing. With the points selected, press ⌘-K and the dialog box announces what angle you have selected. Click OK to accept the angle; all movements and transformations of objects will follow that angle whenever you use the Shift key.

Also, any squares, rectangles, circles, and ovals that you subsequently create align their symmetrical anchor points with

the new grid. (Objects you have created before changing the axes do not shift, however.) This greatly simplifies the creation of axonometric drawings, as well as technical line drawings involving tightly spaced lines and complex perspective angles. Angles don't have to be figured, checked, and rechecked. With the help of the almighty Shift key, simple lines and complete figures can be forced to align with one another along the same invisible lines. Even text follows the current angle of constraint.

Using any of the transformation tools—scale, rotate, reflect, and shear—with the Shift key forces the transformation to follow the same invisible grid.

For example, holding the Shift key down while scaling an object restricts it to expanding or shrinking only in the grid's eight basic directions. Rotating an object about a point with Shift held down forces it to snap into one of eight positions. When you reflect an object while pressing the Shift key, the reflection can appear across only one of the eight angles. And the orientation of an object you shear while holding

(continues)

Illustrator's Compass

Ordinarily *Illustrator*'s angles of constraint match the eight points of the compass in the center foreground of this drawing, but you can reset the angles. You can rotate, scale, shear, or reflect objects along the constrained paths—just press the Shift key while executing the transformation. Here, the rotation and scaling were limited to 45-degree rotations, making a complex geometric design easy to create.

How To/Insights

down the Shift key follows—you guessed it—any one of eight angles. With judicious use of the Option key you can create copies of the original object in perfect alignment with the original. By scaling, rotating, reflecting, or shearing, you command a wondrous array of special effects.

For us lowly mouse jockeys, however, the most important use of *Illustrator's* invisible grid comes in the daily demands for tables, graphs, charts, logos, icons, and simple but elegant line drawings. What once might have taken hours with pen, ink, protractor, and T-square now takes only a fraction of the time. Select, move, Shift/Option, release, ⌘-D, ⌘-D, ⌘-D...

No grid in *Illustrator*? Hah.

Through the Looking Glass

A trouble spot we encountered when learning *Illustrator* was in mastering the Reflect tool. It's easy to understand if you take its name literally. Use this tool as if you were setting the edge of a mirror down to reflect something you've drawn. You set two points with the tool to define an imaginary line that represents the edge of the mirror. If you hold down the Shift key while doing this, the reflection aligns with one of the current angles of constraint. If you hold down the option key, the reflection leaves the original in place and creates a copy across from it. We often use the Reflect tool to create the other half of a symmetrical figure, copying across the vertical and horizontal axes and then joining the connecting anchor points.

Incidentally, we rarely trust fate by reflecting objects—for that matter, scaling, rotating, or shearing them—manually. Whenever you employ one of *Illustrator's* four transformation tools, hold down the Option key when you click to establish your first point in the drawing. The dialog box that appears allows you to specify exactly how much and in which direction you want things to happen. And ⌘-D allows you to repeat any operation as many times as necessary.

The Skinny on Scanning

Although people use *Illustrator* as a freehand drawing system, Adobe designed it primarily to be used with scanned im-

ages called templates. Preparing the scanned image properly can save hours of time in obtaining a satisfactory working image. A scanned image is brought into *Illustrator* as a bit-mapped image on a non-printing background.

There are several adequate scanners on the market, but our current favorite is Thunderware's ThunderScan unit. For the price it is the best digitizer for black-and-white line art, though it works better with the ImageWriter I. The software that accompanies ThunderScan lets you manipulate the image in FatBits directly in the scanned-image window. Alternately, you can export a single page of the image to your favorite paint program (*MacPaint*, *FullPaint*, or *SuperPaint*) and doctor it there.

The most common complaint about scanned-image templates in *Illustrator* is that they end up being skewed or distorted. You can avoid this with a little care. If you start with a photocopied image, take the time at the copier to make sure your image is properly aligned on the page. Run test copies of the original until you are completely satisfied with the alignment. If you are copying the image from a book, flatten the pages on the copier glass. Excessive curl on the pages distorts the copied image. Make sure there is plenty of white space surrounding the image, especially at the top of the page.

When you take the photocopy to the digitizer, again make sure the image is lined up squarely for the scanning head or on the glass surface of a flatbed. Position the photocopy against the printer's platen; pull it about halfway way through the roller with the paper bail pulled away from the paper and the tension released. Now square up the image, using the paper bail as a guide. If the image is slightly skewed on the photocopy, skew the page to compensate so the image is lined up in the printer. Engage the tension, put the paper bail against the photocopy, and scan.

On a flatbed scanner you may need to scan repeatedly until you get the alignment just right. It is far easier to square the image now than to try to fix it in a paint program.

Remove artifacts of the digitization process—spurious dots and shadows—from the scanned image with the eraser in

ThunderScan's image window or in your favorite paint program. You may want to go into FatBits to quickly eliminate the finer artifacts of digitization. You want to start with the cleanest template in *Illustrator*; so your tracing will accurately represent the original art. Tracers less finicky—or more hasty—than we are might be content to merely overlook the extraneous dots as they go along.

Clipboard Realities

A great deal of confusion and controversy surrounds the issue of importing *Illustrator* art into other Macintosh programs. Even if you're not using a program (such as *PageMaker*) that supports the Encapsulated PostScript Format (abbreviated EPS or EPSF), you can import *Illustrator* art in PostScript form into most programs that support the Macintosh Clipboard or Scrapbook.

The key to profitable exporting is pressing the Option key when you copy. That makes a PICT-format image of what you've selected to copy from *Illustrator*. However, this is no simple PICT image. Embedded in it is the PostScript code necessary to draw the image after you paste it into a program such as *Microsoft Word* or *ReadySetGo*. As long as the program supports the Clipboard properly (which is not always the case) the image should print properly. Try this for yourself with your favorite applications. We have confirmed that this process works for *Trapeze 2.0*, *Microsoft Word 3.01*, *ReadySetGo* versions after 3, and *PowerPoint*. One exception we've identified is *Cricket Draw* version 1.0, which makes an odd array of boxes instead of the image you expect. And if you export an *Illustrator* image into a paint program, it becomes a simple bit map.

The MAC GROUP

and more...

Circle 599 on reader service card

The Parallel Printer Link

If you own a Mac Plus, SE or II, at last there is available a link to all popular parallel printers. For 9 pin printers it's the Grappler® C/Mac/GS* and for 24 pin printers or laser printers use the Grappler® LQ.

Mac's Missing Link

The Evolution of Printer Connectivity

Since the dawn of the Macintosh,™ connecting anything but an Apple® printer has been a scientific challenge. Drivers, installers, custom cables, page size adjustments and other "solutions" have defeated even the heartiest adventurers. Now, the Grappler C/Mac/GS (for 9 pin models) and the Grappler LQ (for 24 pin and laser models) make connecting a non-Apple printer as easy as plugging in a cable.

The secret to our successful interface is that the Grappler uses Apple's existing printer drivers which are already compatible with all your software. The Grappler performs two important tasks. First, it converts serial to parallel. Then, it interprets the Imagewriter II or LQ code into your unique printer codes. So all you do is set the Grappler's single DIP switch once and plug it into any Epson, Toshiba, Okidata, Star Micronics, Panasonic or other supported dot matrix printer.** It's that easy!

The Revolutionary Laser Link

The Grappler LQ goes beyond a 24 pin dot matrix printer interface. With powerful spooling software, it uses the ImageWriter LQ output to create comparable hi-resolution images on any HP compatible laser printer.

Now the printers you have serving other PC's can work for your Mac as well. The Grappler LQ brings the cost of laser printing within the reach of the rest of us.

A Trusted Family Name

Although the Grappler series is new to the Macintosh, it is well known for enhancing Apples. With over 550,000 units sold, Grappler printer interfaces are among the most popular additions in the history of the personal computer. With a reputation for quality, innovation and excellence, you can trust Orange Micro for your Macintosh printer interfacing needs.

*The Grappler C/Mac/GS version also serves as an interface for the Apple IIc and IIgs.

**Ask your dealer or call Orange Micro for specific model compatibility.

"Quality Apple® Enhancements since 1980"

Mac Charting Tools

Turn your Excel spreadsheets into something worth looking at: charts for presentation and persuasion

by Michael Alexander

Look at the chart on this page. Now turn the page to see the table entitled "Downhill Ski Stats." They both say the same thing; the chart says it faster.

Charts and graphs are visual, and in this case a look is worth the 102 boring words I wrote—and discarded—that would have explained the trend in Olympic downhill skiing. A chart helps viewers quickly understand the relationships that series of numbers represent.

In business, numbers are for bean counters, trends and summaries are for decision makers. Corporate annual reports, the *Wall Street Journal*, and the weekly news magazines have long been filled with graphs (or charts, they're the same thing). Your local paper probably prints more graphs these days, thanks to the influence of *USA Today*, which discovered how much readers love the way graphs present information, and thanks to the Macintosh, which makes graphs easy for newspaper artists to produce.

The Mac also makes it easy for individuals to create their own charts and graphs, particularly with an integrated spreadsheet and graphing program like *Microsoft Excel*. According to Microsoft, more than 75 percent of *Excel* graphs created are used for presentations. If you use charts to persuade or inform others, this article can help you increase the power of your visual communications.

The following assumes that you've done some *Excel* graphing. If you haven't, you'll still be able to follow along, but you might also want to refer to the chart section of Douglas Cobb's *Excel in Business* (Microsoft Press, 1985), a good tutorial. Better yet, throw away Microsoft's often in-

comprehensible manual, and use Cobb's book for reference, too. For a quick decoder of *Excel* chart terminology, see "Chart Parts."

One last thing before we begin: a bow to Nigel Holmes of *Time* magazine (see "A Chart Master's Advice"). Holmes is the acknowledged master of making statistics understandable and interesting, and his ideas are the foundation of this article. Some of his magic depends on graphics arts skills that are beyond the ability of most people

in business, but Holmes's success stems primarily from an inventive mind, a ready wit, and clear analysis. You can apply the same qualities to your graphs.

Column, Line, and Pie

The type of chart you choose depends on the data you want to show. *Excel*'s Gallery menu offers seven types of charts, but I will focus on three major categories.

■ **Column charts** Column charts show quantities. The height of each column represents the amount of data being

Racing Downhill

Winning times for Olympic skiers. From an Excel graph, the artist created this vivid chart in Adobe Illustrator.

How To/Mac Tools

Downhill Ski Stats

Year	Winning Time (in minutes)
1948	2:55.0
1952	2:30.8
1956	2:52.2
1960	2:06.0
1964	2:18.16
1968	1:59.85

These skiing statistics are the basis for the much more engaging chart on the previous page.

Which way would you rather present increased productivity? Charts give dull numbers a lift.

counted. By comparing column heights for different products sold, for example, you can easily see the relationship of the quantities and tell which sold the most. That's why column charts are good for comparing quantities for a given time period. You can also use a column chart to show how the quantity of a single product changes

over time, but do so when you want to emphasize the quantities themselves.

Bar charts are horizontal column charts, and they provide one advantage when you're working with *Excel* on the Macintosh. *Excel*'s plot area and the Macintosh screen are both horizontal. A simple and clean horizontal chart in *Excel* allows up to 15 products to be ranked, and there's more room for labels along the vertical category axis.

If you have too many bars, arrange products in small groups and plot those. Then make a summary chart of the groups. When you have lots of data points, consider a line graph.

■ **Line graphs** With a line graph, you can show trends as quantities change over time. Instead of emphasizing the quantities, line graphs highlight change. (The British call them fever charts; traditionally, the line graph has been used to track the rise and fall of temperature.)

\$19.95/\$24.95 in Canada

The time period goes on the horizontal (or category) axis, and quantities on the vertical (or value) axis. You may confuse readers if you flout this convention.

Each data series you plot produces a separate line. This is useful for comparing the trends of different products over the same time period, but rarely can a chart show more than four lines without confusion, particularly if the lines intersect.

■ **Pie charts** These are best for showing quantities as proportions of a whole. If you're dealing with percentages, consider the pie chart first. A pie represents just one data series; the slices are the data points. Avoid thinly sliced pies—more than eight slices are hard to label and read. It's possible to compare two pies if each has just a few wedges. For example, one pie could show the proportion of teenagers, young adults, middle-aged people, and the elderly in the American workforce in 1970; another could show those proportions in 1980.

As you can see, your data largely determines which of the three chart types will best present your data. With *Excel*, however, you can experiment a bit. The program's ability to create simple charts easily on screen allows you to switch quickly among different types of graphic representation. But before you create finished charts for presentation, take some time to analyze what data you want to graph—and to prepare your spreadsheet.

What's the Point?

Charts are for communicating. Ask yourself some questions to make sure you're on the right track before you prepare them.

Naturally you understand the chart, but will your audience? Will the chart draw attention to the most important information? Who will see the chart? Specialists, or just folks? Large group or small? Is the subject of the chart entirely new to your audience or are you updating material they know? How much time do you have to inform them?

What is the most important number, or numerical relationship, you want to convey? Once you pin that down, you know the message of your first chart. If you present other information on the same chart, will it obscure your main idea?

Consider whether your purpose is to inform your audience or to persuade them to take action. Then evaluate the tone of your presentation. Can you perk up interest by using catchy titles or subtitles? Should

A Chart Master's Tips

Time magazine's Nigel Holmes says, "Whatever computer programs do to plot statistics, you have to do more to lodge them in peoples' brains."

Holmes adds a visual symbol that tells the readers what a chart is about. "Since you're doing a visual anyway, say visually what the numbers are about. If you're showing automobile sales, instead of a bar chart, make a car chart."

Chart Art

Not many business people have the graphics talent to create the kind of charts that Holmes advocates, and it would be hard to justify such effort and money for, say, a department planning session. But companies spend a lot of time and money on presentation visuals, and that's where graphic artists come in.

Holmes says show your *Excel* charts to the artist. "Then explain the point of the chart. The illustrator can help you make that point."

When Holmes came to *Time* in 1978, "charts were necessary evils." He turned them into one of the magazine's distinctive features, and himself into the

magazine's executive art director. His charts are often funny and always imaginative. "But I'm not just dressing up the numbers," he cautions. "If the readers don't get the statistical information, the chart fails."

Presentation

Holmes's graphs are memorable, but he's also famous for his presentations to live audiences.

"Any presentation," he says, "is theater." He warns against showing long series of charts. Instead, he intersperses charts with photographs of the subject matter, and he changes the pace by turning off the visuals and just speaking.

In a recent talk at Stanford University, he projected a chart grid and used it as a background for a bar chart of helium-filled balloons on strings of different lengths. Oh, you prefer a line chart? Holmes whipped out a portable vacuum cleaner, blew up a 15-foot-long tubular balloon, and had a member of the audience hold it at a 30-degree angle as the graph line: sales were up. It brought the house down.

"Draw it again, Sam..."

Here's looking at...

Introducing "Draw It Again, Sam,"™ the newest drawing program for Macintosh™. With powerful extended features, it adds new dimensions to your Mac graphics.

If you have used MacDraw™ or MacDraft™ you've felt the power that a drawing program can put in your grasp. Imagine the same power brought to an even higher level, with features like libraries, layers, color, advanced text features, and a wide array of graphic display modes... Imagine "Draw It Again, Sam."

Libraries Were Never This Much Fun

Only "Draw It Again, Sam" lets you create your own graphics and text libraries. Create any image, simple or complex, and copy it into a library. Click on an icon-like symbol or on the image's name in a menu, and place the image anywhere on any drawing. Store and retrieve frequently used images, text, or logos, building large libraries (up to 500 images) for drafting, designing, or just for fun. No more rooting through scrapbook files, no more wrestling with the clipboard, and no more wasted time!

Create a Masterpiece — Layer by Layer

Only "Draw It Again, Sam" lets you create and use up to ten transparent drawing planes. You can group similar objects together, as an architectural blueprint or an anatomical drawing. Peel them away to reveal layer after layer of detail. Or view them all while working on only one — and avoid those accidental mouse-clicks that make doing detailed drawings such a trial. Use layers in conjunction with colors to

produce spot color separations with ease or extend a single drawing into an animated series. You can even import a drawing and work over it or behind it without touching the original. Save or print the drawing layer-by-layer or as a whole. The possibilities are endless!

Amazing Graphic Flexibility Is Yours

"Draw It Again, Sam" uses the Macintosh's drawing modes to their fullest potential. Your objects can be in opaque, inverted, clear, or erased modes. You can experiment with overlaying transparent colors and patterns, you can even extend your drawing skills beyond the basics and generate an endless set of special effects. The countless colors and shapes achieved by this program are breathtaking.

To Paint or Not to Paint

Version 2.0 of "Draw It Again, Sam" adds a full set of painting tools to the drawing

ones. Now you can combine the fine detail of bit-mapped graphics with the flexibility and ease of object-oriented drawing. And you can use both paint and drawing tools on the same layer — either side by side or overlapping. The best part is, "Draw It Again, Sam" is compatible with other paint, draw and page layout programs, allowing you to import and export art forms.

You Must Remember This...

With its comprehensive set of features and ease of use, this program is one you have to get your hands on. To find out more, or to order your copy, call (215) 644-3580 and say, "Draw It Again, Sam."

How To/Mac Tools

Good Grief

What's wrong with this picture? Nearly everything. This Excel chart is lost in a mass of visual clutter, and there's no source for the data. Most important, the column-chart style emphasizes each year's sales revenues of the two products, instead of the trend over time.

Source: Cat Demographics

Good Graph

Compared with "Good Grief," this Excel chart simply and clearly shows the underdog brand overtaking the leading brand.

the chart go to a graphic artist for embellishment?

Your answers will tell you what style of chart to use, what data to present, and how to present it. Once you've answered the questions, it's time to open your spreadsheet.

Lining Up the Numbers

Complete your spreadsheet design before creating any charts. If you change the location of cells in the chart selection, Excel may chart the new data incorrectly. Changing data within cells causes no problems, but if you must relocate cells, make a new chart—just to be safe.

The best format for a spreadsheet may not provide the best foundation for a chart. Spreadsheet labels may be too long. Cells or arrays you want to plot may be scattered across a worksheet. Cell formats get in the way of graphing. Blank lines that make the data more legible on the spreadsheet may create blank data series on a chart. Such discrepancies can cost you much time cutting, pasting, reformatting, and chasing around the spreadsheet. Instead, create a

separate charting section on your spreadsheet with its cells linked to the main spreadsheet cells. Or create a separate worksheet linked to the main worksheet.

In the chart section of your worksheet, watch out for distracting trailing zeros in labels. Graphs are for summary, not for precise detail. When you chart numbers, such as the tickmark labels on the value axis, round them off so only the significant digits show. In the "Good Grief" example, all those zeros in the tickmark labels (\$10,000,000 through \$70,000,000) cause viewers' eyes to glaze over—and take up space you'd rather use for the graph. Round the numbers to 10 through 70 and note in the subhead that the values are millions, so viewers can digest the data more quickly (see "Good Graph").

Creating a Chart

To create a chart, select a continuous range of cells (containing data and labels) from the spreadsheet. Choose New from the File menu and double-click Chart in the dialog box. (The keyboard shortcut is **⌘-N, C, O**. Don't bother waiting for the dialog box before pressing the letters.) Excel cuts and pastes the selected data into a default

Graphic Artists...Creative Geniuses... and Aspiring Artists...

Win A \$10,000 Mac II Package!

Announcing the "Draw It Again, Sam..." Graphic Arts Contest

If you've been waiting for your big break in graphics your time has finally come, thanks to Aba Software, the creators of "Draw It Again, Sam."

It's the only drawing program that gives you up to 10 layered drawing planes, limitless text and art libraries, drawing modes, and full paint capabilities. There's no other drawing program like it.

To enter, just take your copy of "Draw It Again, Sam," demonstrate its features the best way you can, and let your imagination go!

CATEGORIES

Submit your work of amateur or professional "graphic excellence" in any of the following categories: Commercial Art, Technical Art, and Fine Art.

PRIZES

Grand Prize

The best overall work will receive an Apple Macintosh II computer featuring a 40 megabyte hard disk, color monitor, two megabyte RAM, retail value over \$10,000!

First Prizes

The best work from each of our three categories will be awarded an Apple Macintosh SE computer featuring a 20 megabyte hard disk, retail value over \$3,500!

Best Amateur Artwork Prize

The best amateur work will be awarded the first prize Macintosh SE package outlined above.

Honorable Mentions

Bask in the limelight! Twelve runners up, selected from all categories, will have their work published, along with the other winners in the August '88 issue of a national "Mac" magazine.

For more information, call or write:

P.O. Box 850, Two Davis Avenue
Frazer, PA 19355-0915
(215) 644-3580

RULES

All artwork must be produced with a registered copy of "Draw It Again, Sam" software. Entries are limited to one per person, per category. All artwork becomes the sole property of Aba Software, Inc. and contestants give up all rights and claims in connection with its unlimited use. All finished artwork must be received by May 7, 1988. Entries will be reviewed by a panel of judges made up of industry leaders and artists. A complete list of winners' names will be available from Aba Software, Inc. Winners will be notified in writing by June 15, 1988. Employees and Associates of Aba Software, Inc. and their families are not eligible for this contest.

ENTER TODAY!

YES, Enter my work in the "Draw It Again, Sam . . ." Graphic Arts Contest! Please print and fill out completely. Mail with your entry to: Aba Software, Inc., P.O. Box 850, Two Davis Avenue, Frazer, PA 19355-0915

How To/Mac Tools

column chart. Choose another of the 42 chart types from the Gallery menu, and *Excel* instantly redraws the data in that style. (For a quick review of *Excel* chart terminology, see "Chart Parts.")

If you have settled on a type of chart, make that the default. Select the type from the Gallery menu, then choose Set Preferred Format from the Chart menu. After that, no matter what chart type you're using, you can convert it to your preferred style by choosing Preferred from the Gallery menu.

Most people use the Gallery to select a chart type. That's fine. But if you add unattached text, patterns, special formatting, and other embellishments, you'll lose most of your custom settings when you switch chart types in Gallery. Instead, change the chart type by selecting Main Chart Type on the Chart menu.

What's the difference between making a Gallery selection and starting from Main Chart Type? The Main Chart Type and Main Chart commands give you control over the entire palette of *Excel*'s chart types. The Gallery offers you a limited selection—the most common types. You can be a painter who starts with a blank canvas, or one who paints by numbers.

Customizing Details

Once you have a chart type that will best display your data, you may want to change other preferences, too, such as sizing and typeface. Before you begin modifications, though, establish the finished size of the graph and resize the window accordingly. Click the zoom box of the window to view a screen-size chart instead of *Excel*'s little default size. Then resize to fit your finished layout. Otherwise you may waste a lot of time making refinements only to discover that all the category tickmarks overlap when you print smaller than the size you worked on.

Now, on to the fine points. Even experienced graphers often don't realize how much graphic control *Excel* offers. You can customize nearly every aspect of a chart by choosing Patterns or Text from the Format menu. Try it out by selecting an element, say the background or the border of the legend, selecting the appropriate command, and then experimenting with the options in the dialog box. As you explore, the *Excel* manual's miserably cryptic explanations of these features will begin to make sense.

The VT600's resolution of six hundred dots per inch insures smooth curves and sharp detail both at large sizes and in small text—as shown in this block of eight-point copy.

See it in our fine print . . .

At 300 dpi, hairline strokes and delicate serifs—the hallmarks of certain typestyles—are either sacrificed or distorted. At small sizes, 300-dpi characters such as these begin to fill in. At large sizes, character edges can appear decidedly ragged.

... and in the quality of our smooth headlines and crisp illustrations. Until now, you've had to choose between the cost savings and convenience of plain-paper output and the high quality obtained from phototypesetting.

The VT600 eliminates the trade-offs. With an imaging resolution of 600 x 600 dots per inch, a VT600 produces camera-ready typeset text and graphics on plain paper, right in your office. Because VT600 images contain four times the information of 300 dpi output, all the subtleties of graphics and text are reproduced with exceptional fidelity. The VT600—a breakthrough for electronic publishing.

PostScript compatibility—the VT600 plain-paper type-setter is plug-compatible with your existing front-end PostScript applications.

Up to 150 typestyles on disk—for increased system performance, flexibility and efficiency.

Up to 10 prints per minute can be generated by the VT600—as much as six times faster than other laser printers for certain applications.

Low cost per print—one-third the cost of phototypesetting.

The convenience of plain-paper imaging—immediate results without chemical processing.

Designed for the office—attractive packaging, silent operation, very small footprint.

For complete information call 800 631-8134; in New Jersey call 201 887-8000, ext 999.

The VT600 . . . advancing the state of the art of laser printers while preserving high aesthetic standards for type and graphics.

Lies, Statistics, and Graphs

Graphs lie. Better than raw numbers. Take a line graph, for example. Its most memorable feature is the slope of the line. A steep angle up means profit sharing for everyone. A steep angle down means look for a new job.

In truth, success or failure may be concealed by the graph's scale. When one axis represents time, slope can be correctly interpreted only by examining both scales.

From "Graph 1," it appears that unemployment was high in 1971. But was it? Not if you refer to "Graph 2." Uneven time series, as in "Graph 3," can produce equally misleading results. And of course, if you want to appear to say something while saying nothing, show a graph without a scale. There are dozens of ways to distort statistics with your graphs. A few traps you might

fall into with *Excel* are listed here. For a whole book on the subject, consult Darrell Huff's *How to Lie with Statistics* (W.W. Norton, 1954).

The stacked-line charts you can create with *Excel*'s Main Chart dialog box are nearly impossible for the reader to sort out; don't use them.

If you use symbols instead of oblongs in column or bar charts, watch for subtle distortion. A manufacturer that sells four times as many cars ought to show four more car symbols than the other maker, not one car symbol four times as big—that would make it 16 times greater by volume.

This recitation is not an exercise in moralizing, though graphic liars tend to be struck by particularly scenic lightning bolts. The worst data distortions are unintentional.

Graph 1

Graph 2

Graph 3

Source: Bureau of Labor Statistics

One thing you'll discover is that *Excel* can go pattern crazy. If your taste in clothes runs to plaid jackets worn with diagonally striped pants, paisley ties, and tie-dyed shirts, *Excel* offers the opportunity to express your visual sophistication. You set the background pattern by choosing Select Chart (or -A) from the Chart menu. I recommend sticking with the default Invisible. The other chart background patterns produce a jarring contrast with the white field that automatically appears under any type. Sure it's legible. It's also ugly.

Some background patterns may look OK in the plot area, as long as no text appears atop the pattern. Be careful of the grid pattern, though. It masquerades as the chart grid, but only on close examination will the viewer realize it's just a design

whose lines don't have anything to do with the axes tickmarks. The horizontal-lines pattern is similarly misleading. If you need grid lines, choose Axes from the Chart menu, and click the boxes you want.

If you like a border around your chart, try adding a shadow border for a three-dimensional look.

Should you choose Text from the Format menu and click OK, *Excel* will change all text in the chart to whatever settings were selected. Do it by mistake, and all your carefully formatted text turns into Geneva 10. Undo-ably.

The Category Axis

Often the category tickmark labels don't fit comfortably on the axis. Abbreviate when you can—one- or three-letter abbreviations for months, for example—on

the charting area of your spreadsheet. You've gone too far, however, if viewers don't instantly know what your shorthand represents.

To avoid overlapping names, label only every second or third tickmark. Select the category axis and choose Axis from the Format menu; then in the box, type the desired interval between labels. Typing a 2, for example, places a label on every other tickmark.

The category axis label often repeats the title, subtitle, or tickmark labels. Edit your wording; the world knows that 1986, 1987, and 1988 are years.

If a column chart lacks space for the

category tickmark labels, try switching to a bar chart. Even in bar charts, keep the category labels short so the text doesn't dominate your visual message.

The Value Axis

Excel places the value axis on the left of the chart. *Time* magazine's Nigel Holmes argues that it often more naturally belongs on the right, because our eyes usually go to the most recent data first. To put the value axis on the right, click on the category axis, and choose Axis from the Format menu. Click Value Axis Crosses at Maximum Category and click OK.

Try not to label the value axis. If the label is horizontal, it seriously reduces the space left for the plot area. If the label is vertical, it's ugly and nearly impossible to read.

If the data cells on your spreadsheet are in dollar format, all the value tickmark labels will show dollar signs before them. Avoid the visual clutter by using a plain format, such as 0, #, ##0, or 0.00, on the spreadsheet. Later, when you tidy up your chart before final printing, create a dollar sign in unattached text, and drag it to the top of the value axis.

When *Excel* creates a graph, it determines the scale by the maximum and minimum values of the data. More often than not, *Excel* makes a good choice, but it often plots values from a starting point greater than zero. This can make data plots look more volatile than they would look in a historical context.

Deciding whether to start the axis from a point other than zero is a very difficult judgment call, and Holmes says he's becoming increasingly conservative on this issue. He cautions not to abandon zero unless the bottom of the data range is high and the variation among data points is small. An example would be a graph of the weekly Dow Jones industrial average, which (at press time) starts around 2000 points and typically varies by only 100 points even on a bad day. Plot that from zero, and the variations disappear.

To redraw a graph using zero as the minimum value, select the value axis, choose Axis from the Format menu, double-click the value in the Minimum box, type 0 (zero), and click OK. If you prefer *Excel*'s original plot, return to the Axis dialog box and click the Automatic box next to Minimum. Of course, you can choose another minimum value and change the maximum value, too.

When you're showing a series of charts, viewers naturally assume that the scale remains the same through the series. That's a good reason to start all charts from zero. But doing that may excessively flatten the differences between some of the data series. An alternative is to start the value axis at zero, then add a symbol that interrupts the axis to show that the scale jumps to higher values (see "Custom Axis"). It would be nice if *Excel* would do this on command (Hey, Microsoft! How about in version 2.0?), but you can make one yourself.

Create the interruption indicator just before you print the chart because it will be unattached text. Select the value axis and choose Axis from the Format menu. Change the Minimum Value to a slightly lower number; that lowers where the cate-

ground hides the old label.) To fine-tune the placement, choose Text from the Format menu. If the value axis is on the left of the chart, click the Right button under Horizontal Alignment. Or vice versa. You might also want to choose Bold and/or a larger type face for emphasis; then click OK. Adjust the size as needed using the handles.

Titillating Titles

Keep titles short. One line is best. A three-line title is always too long. The title can simply identify the subject: "1986 Sales." Or it can reinforce your point: "1986 Sales up 52%."

Either way, the title should focus on your graph's message. Keep out extraneous material, like the boss's name. You may think you're making points, but it's a distraction to your audience. If you must in-

Custom Axis

If you can't plot data from zero, mock up an interruption to the value axis. Use unattached text to produce both the diagonal-line patch and the zero; then drag them into place.

gory axis crosses, leaving room for you to set the zero. Click on a blank area of the chart to be sure no other part is selected. Type two spaces and press Enter. In the center of your chart you will see a blank area surrounded by little black boxes. (If it's sitting on top of an important data point, don't worry.) Choose Patterns from the Format menu and click on the last background pattern, left diagonal stripes; the pattern fills the blank area. Drag the little box onto the value axis, just above where it crosses the category axis. You can alter the size of the pattern by dragging its handles. Adjust its size and position until it appears to break the value axis.

Click again on a blank area, type a 0 (zero) and press Enter. The 0 appears in the center of your chart. Choose Patterns from the Format menu, select the white background pattern, and click OK. Now drag the 0 to cover the bottom tickmark label on the value axis. (The white back-

clude such embellishments, keep them away from the visuals—perhaps at the top or bottom of the page or transparency.

When you create a title using Attached Text from the Chart menu, *Excel* always centers it over the plot area. If you then choose Text on the Format menu, the Horizontal Alignment buttons control how a multiline title is justified. Create an off-center title from unattached text. Since an Attached Text title compresses the plot area, creating the title from unattached text may give your graph more headroom.

Once you've got a snappy, attention-grabbing title, you can use a subtitle to explain vital but mundane items like the units of measurement (millions of dollars, price per 100,000 units, volume in metric tons). That's better than crowding the value axis with a label.

Prices do not include shipping. CA sales tax (6.5%) or special rush handling. Apple is a registered trademark of, and Macintosh is a trademark licensed to Apple Computer, Inc.

Circle 605 on reader service card

A Legend in Its Time—and Place

Excel lets you create a chart legend with a single click. Once your category labels are correct, just select Add Legend from the Chart menu. A legend box appears to the right of the chart, but that's not the best place, because the plot area squeezes left to make room for the legend. In the case of column graphs, that might force columns to narrow down to an illegible size. Positioning the legend across the bottom of the chart may take less room. Choose Legend from the Format menu and click the Bottom option.

But even out of the way at the bottom, a legend is usually not the best way to identify data series. To read the chart you first must look at the line or bar or pie-wedge that interests you, then note its pattern or marker, find its match in the legend box, read the label, and finally look again at the line or bar or pie-wedge you've now identified in order to glean its information. That's not a quick read. For multiseries column charts, legends are OK. For other types, I prefer to label the data plot directly.

You can create such labels from unattached text. Click in a blank area so you don't select a chart element by mistake. Type the label text (keep it short) and press Enter. Point inside the boxed area and drag the text. Place a horizontal label on the steep part of a line so it won't cover nearby data markers. If you're labeling several lines, try to place the labels in a neat stack or row.

You can add a pattern swatch keyed to the legend label and move them together anywhere you want. Create the swatch the same way you made the indicator for a broken value axis. Use the appropriate pattern and surround it with a thin black border. If you're manic enough, you'll eventually create a custom legend, one element at a time. Because all of this is unattached text, produce it just before you print the chart.

Bring the Point Home

Excel's chart palette gives you powerful techniques for emphasizing key information in your graph.

■ **Line weight** When making a line graph, *Excel* normally gives each line the same thin weight. Try using the medium or heavy weight on single-line graphs—or for the most important line in a multiline graph. Select the line, choose Patterns

(continues)

A Special Way to Paste

When *Excel* plots a chart, the top row and the first column of the spreadsheet selection have special meaning. If they contain text entries, the program turns them into category tickmark labels or series names. But what happens when your data is in rows and the label row also contains numbers? Numbers like 1982, 1983, 1984—which you mean to be category tickmark labels. The way *Excel* interprets them depends on the top-left cell in the selection.

If that cell is blank, *Excel* treats the top row of numbers as tickmark labels, just as you

■ Are the data arranged in rows or columns? (Hint: When you plot more than one data series, you have data in both rows and columns. Which is the right arrangement? Imagine that the chart you want to create is a line graph. Which cells do you want to link as a line? Are they in a row or a column?)

■ Are there labels in the first column of the selection?

■ Are there labels in the top row?

Next, copy your spreadsheet selection and open the new chart.

Choose Paste Special from

intend. But if the top-left cell contains an entry, either text or numbers, *Excel* plots the top row as a data series, producing a chart like Product Sales Chart 1 in "Paste Successful." The entry in the top-left cell is usually something extraneous, like Year. Erase it, and the data will plot correctly, as in Product Sales Chart 2.

Another way to create charts gives you total control over labels and data. Select a range on the spreadsheet, look at it carefully, and answer three questions.

the Edit menu. If the choices in the resulting dialog box confuse you, just refer to your answers:

■ If your data are arranged in rows, click Values in Rows. If in columns, click Values in Columns.

■ Check First Column if there are labels in the first column of your selection.

■ If there are labels in the top row of your selection, check Top Row.

That's it. Click OK, and your data should plot correctly.

TUSSEY COMPUTER PRODUCTS

P.O. BOX 1006
STATE COLLEGE, PA 16804

from the Format menu, click on the line weight you want, and click OK. You can also use a gray pattern to make it less important, but forget the striped, diagonal, or crosshatched patterns. Even *Excel*'s thickest line weight is too thin to display them clearly.

You can shade the space between the category axis and the plot line of a one-line graph (to turn it into an area chart). It's an effective technique, especially if you choose a light fill pattern.

■ **Column charts** Use a heavy border around the most important column in a series.

■ **Pie charts** With *Excel*, you can drag one or more slices slightly out of a pie chart to draw attention to them.

■ **Plotting by Number** Help the viewer analyze the data by arranging the bars from longest to shortest, or vice versa. *Excel* ordinarily arranges data series in the order you paste them. You could carefully paste the series together one bar at a time to obtain a smooth sequence, but if you later change the spreadsheet data, the bar lengths may return to disorderly random lengths. It's easier to paste data series all

at once and then change their order if necessary.

To change the plot order, click on a data bar in your chart and note the lengthy series formula that appears in the formula bar below the *Excel* menu. It looks intimidating, but you can ignore everything except the last number. If it's the number 1, that data series is the first one plotted on the chart. If you change the number to 3, *Excel* will replot the chart accordingly and automatically renumber the plot numbers in the other series formulas. By clicking on each data series and changing its plot number, you can turn a jumble into a smooth series.

You can use the same technique to change the order of wedges in a pie chart.

Percentage Charts

Pie charts let you show one percentage; you can put two pies side by side to compare percentages. But to compare three or more data series by percentages, use the 100% stacked chart type that *Excel* offers (type 5 in the Column or Bar gallery). *Excel* doesn't limit the number of patterned segments that stack up to 100 percent, but you might want to exercise restraint. The readers must estimate the per-

cents for most of the stacked segments, so don't overwhelm them with lots of little pieces. Usually three or four data series are plenty for this type of chart.

■ **Printing** When printing on the ImageWriter, your results will usually be more crisp if you select Tall Adjusted from the Page Setup dialog box. If you create test charts on an ImageWriter but plan to make final copies on a LaserWriter, build in some time for making adjustments after you switch printers.

Making a Hit Series

Keep your charts simple—try to present only one idea or one comparison. You can use the chart form, the title, the typefaces, and other design elements to emphasize that one idea. Then use other charts to make other points.

When you create a series of charts, keep the following design elements consistent: typeface, type size, and weight; title locations; axis labels and locations; bar shading and other patterns. Change design elements only to emphasize the point of the new chart.

(continues)

LIFE LINE.

You've put a lot of money into your Apple system. And what's more, it's provided you with the power to be your best. Power you can't afford to lose.

Protect Your Investment.
For just a few dollars you can have the extra assurance that your equipment will be there when you need it. The Grimes Universal Security Kit has been thoroughly evaluated by Apple Computer, Inc. and carries an excellent overall rating. We are an approved Apple manufacturer of peripheral hardware and accessories. So you know the security system will fit like a glove. It plugs right into your

Apple making it virtually theft-free and "borrow-free."
It won't matter if they take your calculator, your phone system, or your entire office. As long as the real power... your Apple Computer System, is still there, you're open for business.

A 24-hour security guard for \$44.95.
Pick up a Grimes Universal Security Kit at your local Apple Dealer today. Or call Grimes for a dealer near you.

Circle 470 on reader service card

If you are creating a series of similar charts, you can save a lot of time by creating a generic chart with all the style attributes of the series. Say you are creating a series of ten charts, and want each to be a column chart with 24-point Helvetica Bold titles in shadow boxes, 12 point Helvetica Italic axis tickmark labels, and a legend below the category axis. You only have to set those style attributes once. Create the first chart. Choose Column from the Gallery menu, and click your chart style.

To set the title style, choose Attach Text from the Chart menu. The radio button for Attach to Chart Title is already selected, so just click OK. Now choose Text from the Format menu and click Helvetica, 12 point, Bold, Border Shadow, and OK. Notice that you have not typed a chart title.

Select the category axis, choose Text from the Format menu, click Helvetica 12 point and OK. Follow the same procedure to set the attributes for the value-axis tickmark labels. Repeat the procedure to create a dummy value-axis label. Choose Add Legend from the Chart menu.

Now the good part. Choose Set Preferred Format from the Chart menu. All your formatting attributes apply to any chart based on any worksheet you create before you quit *Excel*.

But, you'll notice, none of the charts have titles. True. Select the first chart. Choose Attach Text from the Chart menu, click OK, type the title and press Enter. The title appears in 24-point Helvetica Bold, surrounded by a shadow box. Why didn't you type it originally? Because it would have become part of the Preferred Format, and would be the title of every chart you make from worksheets created this session.

Presentation

OK, so you've limited each chart to presenting one idea, and now you have 50 graphs that all look alike, except for the titles and the jiggle of the lines. Resist the temptation to introduce variety by changing half the title typefaces from Times to Helvetica Bold. Instead, throw 40 of the graphs away.

But, you protest, that stuff is important! Ever notice how, after you've spent a few hours in a museum, all the masterpieces begin to look alike? Your audience will react the same way—the more masterpieces you show them, the less they'll see and remember.

Nigel Holmes suggests animating graphs to hold your audience's interest in live presentations. If you are showing line graphs on an overhead projector, you can emphasize a line by tracing it with a colored marker.

Or you can have *Excel* only plot a line's data points, and then connect them yourself as you talk. To do this, select the line by clicking it. Its ends will be highlighted by small circles. Choose Patterns from the Format menu. Click the Invisible button. *Excel* displays only the markers for that data series. If you click the Apply to All box, none of the lines will be displayed. Print the chart, take a minute at the copy machine to turn it into an overhead, grab a fat colored marking pen, and you're ready to wow 'em.

A final word of advice. The most common charting mistake is trying to cram too much information onto a single graph. Charts are good for comparing a few categories of data, or for showing one category. If the charting area on your spreadsheet has a lot of columns *and* a lot of rows, watch out. You're probably better off making a table of figures. And that, of course, you can do with *Excel*'s spreadsheet. □

See *Where to Buy* for product details.

The Best Bitmap Font Editor.

Imagine gaining absolute control over your letters, documents, reports, and pictures, by customizing the actual printed letters themselves. Create unique individual characters never seen before. Call these characters up with the stroke of a key. Size them precisely and repeatably up to 127 points high.

With FONTastic Plus, all this will become second nature to you. FONTastic Plus gives you unlimited access to every Macintosh™ bitmap font. And the power to make as many new fonts as you can imagine. Text fonts, display fonts, symbol fonts, logos or foreign language fonts are all as simple as clicking the mouse.

Fatbits editing like MacPaint™—but with three sizes of fatbits—makes it easy to create and modify characters. Use cut and paste to copy common letter parts from one character to another. Background and guideline layers help maintain a consistent look from letter to letter. An integrated font mover makes installing fonts as easy as cut and paste. Instant print samples let you see how the font looks in print, without having to install it and type a sample.

FONTastic Plus is the next step in font editing. Fast, powerful, easy to use, and only \$79.95.

FOR THE BEST SELLING ACCOUNTING SOFTWARE LOOK FOR THE PEACHTREE LABEL

Back to Basics.
Thousands sold at \$525.
Now just \$199!

Get Back to Basics™

Peachtree's Back to Basics is the most popular accounting system on the market today. And it's no wonder why.

Back to Basics is simple to install, easy to use, and priced in line with what small businesses can afford.

But don't take our word for it. Software Digest, a leading consumer organization, rated Back to Basics number one in overall usability when compared to products costing as much as \$995 and, for the past two years, Back to Basics has won the *A+ Magazine Software of the Year Award* for Macintosh business accounting systems thanks to the votes of over 20,000 Apple users.

No Experience Required

Back to Basics assumes you're an expert in only one business—your own.

- Installation of Back to Basics is painless — read only seven pages in the manual and *spend 30 minutes* using our screen menus.

- If you need to brush up on your accounting, use our accounting primer and tutorial, written by Harvard Business School Professor, Robert N. Anthony, plus our business section on how to handle everyday accounting dilemmas.

\$199

Back to Basics Accounting System became a best seller priced at \$525. Now, as a result of reduced expenses, we are able to offer all three modules — General Ledger, Accounts Receivable and Accounts Payable — in a complete set for just \$199.

Proven Power

Peachtree has long been the first name in accounting software and the powerful features we've included in Back to Basics prove we understand what you're looking for.

- Complete integration of General Ledger with Accounts Receivable and Accounts Payable.

- Single transaction entries up to \$999,999.99 and year-to-date totals up to \$21,000,000.

- Journals and reports updated as each transaction is recorded.

- Void transaction facility automatically creates reversing entry.

- *More than 30 reports* can be viewed on screen or printed.

Macintosh Specific

Back to Basics was written specifically for the Apple Macintosh, not simply converted from another computer version. It uses the Macintosh interface (mouse and visual icons) for system operation and groups functions into on-screen "file drawers" for organization and ease of use.

Back to Basics was a featured accounting system in Apple's initial ads for the Macintosh and is backed by Peachtree's outstanding support, labeled by *InfoWorld* as "the finest in the industry". Support is available as you need it, at a nominal charge directly from Peachtree or through our network of local authorized support centers.

Money Back Guarantee

When you purchase Back to Basics directly from Peachtree Software you're protected with a 30-day, money back guarantee (an option even the most expensive accounting products don't offer).

If you're not satisfied, simply return the complete product in saleable condition within 30 days and your

purchase price will be promptly refunded. For full details, call the toll-free telephone number below.

Invoicing Coming Soon

Back to Basics Invoicing will soon be available for the Apple Macintosh at an introductory price of \$95.

Hardware Specifications

- IBM Personal Computer, PC/XT, PC/AT with two floppy disk drives or one floppy disk drive and a hard disk.
- Apple II+, IIe, IIc, IIGs with 128K and two disk drives or hard disk.
- Apple Macintosh 512K or Plus with two disk drives or hard disk.

Features That Made Back to Basics A Best Seller

GENERAL LEDGER

- On-line help displays Chart of Accounts
- MTD and YTD show on income statements
- Allows automatic Journal entries
- Check processing and printing capability through Cash Disbursements

Updates

This list brings you the highlights of software updates recently received but not yet tested. The first price is the upgrade cost for registered owners; the second is the current list price.

Acta version 2.0 supports multiple outlining windows and multiple file formats, including *MacWrite*, *More*, *ThinkTank*, *WriteNow*, text, and Microsoft Rich Text Format. Symmetry Corp., 761 E. University Dr., Mesa, AZ 85203, 602/844-2199. Free upgrade with return of original disk and upgrade form plus \$2 s/h; \$59.95 new.

Canvas version 1.02 reads TIFF and PICT files without creating any distortion. It creates bezier curves, includes a grabber for hand scrolling, and has a new selection rectangle. Comes with built in F-keys. Automatically repositions ruler shadows and duplicate objects. Text and tool enhancements. Deneba Software, 7855 N.W. 12th St. #202, Miami, FL 33126, 305/594-6965. Free; \$195 new.

Copy II Mac version 7.0 recovers accidentally erased files from all Mac hard disks and fully supports the Mac II. Central Point Software, Inc., 9700 S.W. Capitol Hwy. #100, Portland, OR 97219, 503/244-5782. \$15 with return of original disks; \$39.95 new.

Fontographer version 2.3 adds a circle tool and a faster zooming command; generates more compact PostScript fonts. Non-copy-protected backup copies available.

Altsys Corp., 720 Avenue F #108, Plano, TX 75074, 214/424-4888. \$30; \$395 new.

Laser Author version 1.1 contains new features such as hyphenation with an exception dictionary, page preview, and a faster search and replace. Has the ability to search by style. FLI, P.O. Box 49, Ramsey, NJ 07446, 201/444-5700. Free; \$179.95 new.

LogicWorks version 1.3 supports multiple circuit windows. It outputs PICT files and has a strip-chart printing mode and automatic naming features. Shift-click lets you select arbitrary groups of devices and signals for editing. Multi-Finder compatible. Works with the new LPLC programmable logic device compiler. Capilano Computing, 525 - 108th NE #6, Bellevue, WA 98004, 604/669-6343. \$20; \$199.95 new.

Mac3D version 2.1 incorporates new features including color printing and a Help command. Challenger Software, 18350 Kedzie Ave., Homewood, IL 60430, 312/957-3475. \$50 upgrade from versions 1.0 and 1.1, \$20 upgrade from version 2.0, free upgrade from version 2.0 if purchased after June 15, 1987 (enclose proof of purchase date and return disks); \$249 new.

Microsoft Works version 1.1 supports *AppleShare*. It includes VT52 and VT100 emulation. Microsoft Corp., 16011 N.E. 36th Way, Box 97017, Redmond, WA 98073-9717, 206/882-8080. Free if purchased after July 1, 1987, otherwise \$25; \$295 new.

More version 1.1c uses color in outline and graphic elements; provides color highlighting for individual words or phrases. Color in bullet charts allows for the creation of 35mm slides. New version is bundled with *Acta*. Living Videotext, 117 Easy St., Mountain View, CA 94043, 415/964-6300. \$40; \$295 new.

Plot-It version 2.06 improves rotated text and arrowhead handling. Mesa Graphics Inc., P.O. Box 600, Los Alamos, NM 87544, 505/672-1998. Free if upgrading from version 2.0; \$30 upgrade from version 1.0; \$125 new, plus s/h.

Trapeze version 2.0 adds new charts and new layout options, such as headers, footers, and international formats. New functions include block rearrangement, matrix/modeling, selection, and statistics. Lets you import and export files in PICT, WKS, or text. The user interface and calculation capability have been enhanced. This version supports color display on the Mac II and is compatible with all large screens. Data Tailor, Inc., 3113 S. University Dr. #500, Fort Worth, TX 76109, 817/921-6083. Free; \$295 new. □

To have products listed in this section, send upgraded software, an outline of major changes since the previous release, upgrade price, suggested retail price, company name, mailing address, and phone number to Updates, Macworld, 501 Second St., San Francisco, CA 94107.

Tower of power at a "user friendly" price.

Introducing **APPLE@CRATE**

Our sub systems have been designed to provide quick and easy installation and are fully compatible with Apple Mac Plus, Mac SE and Mac II.

These powerful systems include driver and utility software, an internal power supply,

SCSI cabling, all necessary hardware and have been shock mounted for trouble-free transport.

The Apple Crate comes with a 2 YEAR WARRANTY on parts and labor and a direct wats line to our "72 hour turnaround" service department.

Complies with the limits for a Class B computing device pursuant to Subpart J of Part 15 of FCC rules. Patent pending.

Apple, Apple Mac Plus, Mac SE, and Mac II are registered trademarks of Apple Computer, Inc.

The Apple Crate provides:

- Additional SCSI port which allows daisy-chaining up to 7 SCSI devices
- Convenient fuse holder
- SCSI address select
- Controls and cable controls—clearly marked and easy to operate.

Macworld

1987 Annual Index

by Erfert Nielson

This index covers the 12 issues of *Macworld* published during 1987. It lists most products alphabetically as well as under appropriate subject headings. For example, *Packit III* appears under its own name and under Communications, Public domain/shareware, and Utilities. You'll also find it if you look under File compression. Boldface page numbers indicate a reference to a review (r) or a feature-length article.

Not all reviews are created equal.

Some reviews are press releases. Some are synopses. Some are just paragraphs or rating symbols that can't possibly tell you enough. **MACWORLD** gives you in-depth reviews. Comparative. Analytic. Selective. Solutions-

oriented. Precisely the ones you want.

Month after month, our experts work programs thoroughly to give you the information you need to make intelligent, productive choices. **MACWORLD, The Macintosh™ Magazine.**

MACWORLD GIVES YOU MORE.

Keep your business running true to form

FileMaker Plus. The data base and forms manager from Nashoba Systems.

The winner of top awards from both MacUser and Macworld is now the top-selling data base manager for the Macintosh.* And for good reasons.

FileMaker* Plus is the first product for the Macintosh to combine professional data base management with the ability to produce professional quality forms.

FileMaker Plus makes it easy to quickly create any type of form you want: number-heavy forms like invoices, purchase orders and expense reports; and text-heavy forms like contracts and form letters. You can arrange drawings, photos, text, numbers, logos, and dates anywhere on the page for maximum impact, then preview what you've done on the screen to make sure it's exactly what you want. FileMaker Plus even includes templates for creating mailing labels, proposals, and Rolodex* cards.

FileMaker Plus makes managing your data base just as easy. It automatically indexes every word, number and date you enter. You can look up pricing information and quickly calculate, sort, and summarize your invoices, automate your sales reports, produce contact lists, form letters, and mailing labels. All from the same data, without retyping. You can also exchange information with other applications, like Microsoft* Word, Excel, MacWrite* MacPaint,* and MacDraw* to help you share information and formats.

And FileMaker Plus is on friendly terms with the entire Macintosh family, including the Macintosh 512K, Macintosh Plus, Macintosh SE as well as the Macintosh II, the ImageWriter* II and LaserWriter* Plus, and the latest system software, such as MultiFinder* and AppleShare.*

Nashoba Systems is just as committed to FileMaker Plus today as we were when we first developed it. We'll continue to do all the things that have made it such a success: listen to our customers, provide outstanding free technical support, upgrade our product with the most advanced technology in an easily accessible form, and assure your satisfaction

with our money-back guarantee.*

FileMaker Plus from Nashoba Systems. For only \$295, it keeps your business running in top form.

Call us today for the dealer nearest you. 1-800-274-0610.

— Complete Ready-to-Run Systems — Macintosh Plus Entry System

System includes:

- Macintosh Plus Computer with 1 Megabyte of Ram, Keyboard and Mouse, 1 Internal 800 K Floppy
- Ehman 8000K External Floppy Drive
- Imagewriter II Printer
- Printer Cable
- HyperCard Software
- Maxell Diskettes Box of 10
- Computer Paper Package of 500
- Dust Cover for Macintosh Plus
- Dust Cover for Imagewriter II
- Head Cleaning Kit
- Mouse Pad

Suggested list price \$3450

CDA Price \$2399

When ordering specify package #8801

Macintosh SE Super System

Complete System includes:

- Macintosh SE Computer with 2 Internal 800K Drives
- 1 Megabyte of Memory
- Keyboard and Mouse
- Imagewriter II Printer
- Imagewriter Cable
- HyperCard Software
- HyperCard Software
- Maxell Diskettes Box of 10
- Dust Cover for Macintosh SE
- Dust Cover for Imagewriter II
- Head Cleaning Kit
- Mouse Pad

Suggested list price \$3689

CDA Price \$2749

When ordering specify package #8802

Macintosh SE/20 Super System

Same as the above system but includes the Macintosh SE with built in 20 megabyte hard disk and 1 internal 800K floppy!

Suggested list price \$4489

CDA PRICE \$3349

When ordering specify package #8803

Macintosh II/40 Graphic System

Complete System includes:

- Macintosh II Computer with 40 Megabyte Hard Drive
- 1 Megabyte of Memory
- Extended Keyboard and Mouse
- Macintosh II Video Card
- Apple Color High Resolution RGB Monitor
- Imagewriter II with Cable
- HyperCard Software
- Maxell Diskettes Box of 10
- Case of Computer Paper 1100 Sheets
- Dust Cover for Macintosh II/Monitor
- Dust Cover for Extended Keyboard
- Head Cleaning Kit
- Mouse Pad

Suggested list price \$7849

CDA Price \$5999

When ordering specify package #8805

Microsoft Excel

Version 1.04. Microsoft Corp. For address see *Doug Cobb's Tips for Microsoft Excel*. 512K minimum memory; external drive recommended. \$395. □

MathType

The Mathematical Equation Editor for the Macintosh

Edit equations like this:

And get LaserWriter output like this:

$$\frac{4}{\pi} \int_0^{\infty} \int_0^{\infty} e^{-(x^2+y^2)} dx dy = 1$$

MathType™ knows the rules of mathematical typesetting, so all you do is point, click, and type. Works with any word processor or page layout program. MathType is available now for only \$149. Educ. discounts applicable. Call or write for a free demo disk and brochure with sample output.

6475-B East Pacific Coast Highway, Suite 392
Long Beach, CA 90803 • (213) 433-0685

MACWORLD

The Macintosh Magazine

Free Product Information Service

Get more information on products you're interested in—
simply return one of these cards today. There's no cost.
And no obligation.

1. Your primary job function:

- Corporate or general manager
- Department manager
- MIS or micro manager
- Engineering or scientific
- Professional
- Reseller/VAR
- Self-employed
- Other

2. Number of employees in your company:

- 25 or fewer
- 26-99
- 100-499
- 500-999
- 1000 or more

3. Plan to buy:

- Now
- In 4-6 months
- In 7-12 months
- More than 12 months from now
- For reference only

4. For how many personal computers do you buy products? (Include both company and personal units, please.)

- 1
- 2-4
- 5-9
- 10 or more

5. How many of the above are Macintoshes?

- 1
- 2-4
- 5-9
- 10 or more

It's easy to get more information on products advertised in Macworld.

Here's how:

- Print or type your name and address and circle the appropriate answer to each question.
- Circle the numbers that correspond to the reader service numbers for the products that interest you. These numbers appear in the ads and in the Advertiser Index.
- Apply first-class postage before mailing.

Get more information on products you're interested in—
simply return one of these cards today. There's no cost.
And no obligation.

1. Your primary job function:

- Corporate or general manager
- Department manager
- MIS or micro manager
- Engineering or scientific
- Professional
- Reseller/VAR
- Self-employed
- Other

2. Number of employees in your company:

- 25 or fewer
- 26-99
- 100-499
- 500-999
- 1000 or more

3. Plan to buy:

- Now
- In 4-6 months
- In 7-12 months
- More than 12 months from now
- For reference only

4. For how many personal computers do you buy products? (Include both company and personal units, please.)

- 1
- 2-4
- 5-9
- 10 or more

5. How many of the above are Macintoshes?

- 1
- 2-4
- 5-9
- 10 or more

It's easy to get more information on products advertised in Macworld.

Here's how:

- Print or type your name and address and circle the appropriate answer to each question.
- Circle the numbers that correspond to the reader service numbers for the products that interest you. These numbers appear in the ads and in the Advertiser Index.
- Apply first-class postage before mailing.

Sign up for MACWORLD Expo/ San And save enough

Head for
MACWORLD Expo/
San Francisco
January 15-17
Moscone Center.
And step on it.

Hail the nearest taxi and roll on over to MACWORLD Expo/San Francisco, the original Macintosh computer show.

Test drive an extraordinary array of hardware, software and peripherals first-hand. Weave in and out of traffic. Stop at

hundreds of exhibits. Attend dynamic seminars and workshops run by industry experts. Tune up your Macintosh skills. And more.

In three days, under one roof, you'll pick up tips, tricks, techniques, do's, don'ts, how-to's and what's news that would otherwise take weeks to collect. And if you register before December 15, 1987, you'll save \$5. Enough to pay for cab fare.

**Keep your hands on
the wheel, Mac.**

MACWORLD Expo/San Francisco is a hands-on, do-it-yourself show. It's exciting. It's challenging. It's fun. And it's fruitful.

Create professional-quality business graphics — on the spot. Compose your own newsletter, ads and brochures. Try your hand at desktop engineering and design. Send or receive messages from Mac to Mac. Witness the power of the latest Mac programming environments. Do all this and more in just three short days.

**There's something for
everyone.**

It doesn't matter whether you're a seasoned hack or just out for your first drive. After three days, you'll be chock full of information on what Macintosh can help you do. In the office, in the lab, at school or at home.

Our exhibitors list. (As of August 18, 1987.) A who's who of people who design, develop and produce hardware, software and peripherals for Macintosh. 3Com Corp., 5th Generation Software c/o Touchstone, 800 Software, A.L.P. "Where to, Mac?"

"MACWORLD Expo/San Francisco!"

Francisco by December 15. for cab fare.

There's literally something for everyone — including special programs on computer-aided design, business graphics, communications, desktop publishing, education, programming with Mac and then some.

Taxi, anyone?

Avoid long lines at the door. Register now for this exciting three-day conference. And save \$5.

Simply fill out the coupon and send it with your check for \$35 (or supply credit card information) to the address listed before December 15, 1987. Onsite conference admission is \$40. And no credit cards or checks will be accepted at Moscone Center.

This low \$35 fee allows you to visit all exhibits and attend all seminars. If you just want to visit the exhibits, admission is \$15, payable only at the door.

To register additional people, just copy this form and complete it for each attendee. For group and student rates, please call 617-329-7466 by December 10. This form must be received by December 15. After that, you must register at the show. All registrations are non-refundable.

Don't miss out on this opportunity to take a free ride. Register now and save \$5.

**Here's a big tip.
Register by December 15.
And save \$5 — enough for cab fare.
After December 15 register at the show.**

- ☐ **Yes.** I want to pre-register for MACWORLD Expo/San Francisco, January 15-17, 1988 at the Moscone Center at \$35. Please send my badge to:

Circle 718 on reader service card

Macworld Directory

The Macworld Directory is a comprehensive listing, by category, of products and services available for the Apple Macintosh. It provides advertisers with a low-cost advertising alternative and our readers with an easy reference guide.

FORMAT: The standard format includes a product ID, a 300-character descriptive ad, and a company name, address, and telephone number.

Advertisers may choose among categories already in use, or they may create their own. Display advertisers can cross-reference their current ad to the Macworld Directory for increased exposure.

RATES: Listings are accepted for a three-time consecutive insertion at a rate of \$965. We offer a six-time insertion at \$1650 that reflects a 15% frequency discount. Listings must be prepaid (except for established display advertisers) upon submission of ad copy. Checks, money orders, Visa, and MasterCard are accepted.

DEADLINE: For copy deadlines and further information please contact Niki Stranz, your Macworld Directory Account Manager, at 415/546-7722 or 800/435-7766 (800/435-7766 in California). Please send copy and prepayment to the Macworld Directory, 501 Second St., San Francisco, CA 94107.

■ Accessories

○ Bags

Cordura Bag for Mac SE

The Word is Out...

“Absolutely AMAZING word processing program. I want it WriteNow!”

Robert Forras,
MacTimes

“WriteNow feels perfect.... It's hot. Highly recommended. This is THE word processor to use if you use a Mac.”

John Dvorak,
San Francisco Examiner

“Right now, WriteNow comes the closest to delivering on the promise of future word processing.”

Michael Miller,
InfoWorld

“This is the word processor that we designed and built Macintosh for.”

Steve Jobs,
NeXT Inc.

“T/Maker's WriteNow For Macintosh is a polished word processor that retains the elegance of MacWrite but adds features like multiple windows, footnotes, multiple columns, and a spell checker.”

Dan Farber,
MacWorld Magazine

“...WriteNow adds up to a great new word processor. ... its ease of use and speed put it way ahead of Microsoft Word and MacWrite for most jobs.”

Vicky Jo Varner,
The MACazine

Best New Word Processor
MacUser Magazine 1986

January 1, 1988 I resolve to...

Having trouble coming up with this year's resolutions? Tired of "I resolve to lose weight, quit smoking, and work out every day?" Don't despair, we've worked up a whole list of snappy new resolutions for you to choose from. So, repeat after us—I resolve to...

1. Keep all my computer equipment nice and clean. (This will not only improve your computer's performance, it'll make your mother happy. Easily achieved with Dust Covers and Cleaning Kits.)

2. Protect my Mac from (a) power problems with a System Saver® Mac and (b) the criminal element with an Apple® Security System.

3. Stop annoying people with my ImageWriter®. (No, don't throw it out, just put a Printer Muffler™ on it.)

4. Stop cursing my mouse when it runs off the edge of the desk. (Hint: space is no problem with a Turbo Mouse™.)

5. Lose weight, quit smoking, and work out every day. (Just kidding.)

6. Call Kensington for more information. (Maybe you should make this #1.) Call (800) 535-4242. Outside the US, or in NY, call (212) 475-5200.

System Saver Mac, \$99.95*

Turbo Mouse, ADB or reg., \$129.95

Mouseway, \$9.95

Anti-Glare Filter, \$49.95*

Printer Stand, \$19.95

Tilt/Swivel, \$34.95

Copy Stand, \$29.95

**Printer Muffler 80, \$59.95
Printer Muffler 80 Stand, \$29.95**

AppleTalk Clips, \$25.00 for 25

Dust covers, \$9.95 to \$24.95

Mouse Pocket, reg. or ADB, \$9.95

**Disk Drive Cleaning Kit, \$29.95
Mouse Cleaning Kit, \$24.95**

KENSINGTON™

Apple Security System, \$49.95

Disk Pocket, \$9.95

*Available in two colors—original Apple Beige and new Apple Platinum.
